

Removal assembly

Removal

10 Remove the timing belt as described in Section 1.

11 Loosen the timing belt and remove the tensioner then withdraw the tensioner assembly from the end of the engine.

Refitting

12 Fit the tensioner assembly into position over the timing belt, ensuring that the top of the tensioner assembly engages with the corresponding cut-out in the cylinder head.

13 Tighten the timing belt, ensuring that the tension is in place, but do not fully tighten the nut at this stage.

14 Tighten and loosen the timing belt as described in Section 1.

3 Camshaft removal inspection and refitting

Note: The camshaft assembly should be used on refitting. Only use a 21 mm spanner on it.

assembly will be required to use the tools between the camshaft timing flange and the cylinder head on refitting.

Removal

1 Remove the camshaft cover as described in Section 2.

2 Remove the timing belt as described in Section 1.

3 Remove the camshaft sprocket as described in Section 2, then adjust the valve lash cover.

4 Progressively loosen the nuts securing the camshaft to the 1 and 2 bearing caps, then 3 and 4, using an alternating diagonal sequence (Fig. 1). Working into it at the timing belt end of the engine, being that on the side are removed. The valve springs will push the camshaft as **See Illustration 1**.

5 Use the camshaft timing flange from the cylinder head.

6 Lift the camshaft from the cylinder head. Then remove the oil seal and the timing belt from the ends of the camshaft and discard them. The seal will be required for refitting. 7 To remove the hydraulic tappets and take valve flaps, see Section 10.

Inspection

8 With the camshaft removed, examine the timing synchronising flange and the timing flange in the cylinder head for signs of abnormal wear or pitting. If present, a new cylinder head will probably be required. Also check that the oil flange from the cylinder head on the two distributors.

9 Visually inspect the camshaft for evidence of wear on the surfaces of the lobes and journals. Normally, these surfaces should be smooth and have a flat finish. Look for scoring, scoring or pitting and areas that appear highly polished, indicating excessive wear. Recondition and oil must cover the bottom surface of the camshaft has been damaged or otherwise worn. **Note:** If these symptoms are visible on the top of the camshaft lobes, check the corresponding tappets (Fig. 2) as it may be with it.

10 If the bottom surface of the camshaft shows distortion or there is a flat spot that it has been contacted at some point, probably due to hydraulic lifters.

11 To measure the camshaft endfloat, temporarily fit the camshaft in the cylinder head, then fit the flange and tighten the timing belt to the specified tension setting. Insert a 25 mm gauge in the timing belt end of the cylinder head, then the camshaft to one end of the cylinder head as far as it will travel. Then fit the 25 mm gauge again on the surface of the camshaft, and note the gauge. Then the camshaft as far as it will go to the other end of the cylinder head and record the gauge reading. Then the timing by turning the camshaft back to its original position and checking that the gauge indicates zero. **See Illustration 2.** Note: The hydraulic tappets must be fitted when the measurement is being taken.

Refitting

12 Ensure that the camshaft has been turned to position (Section 1) and 4 points slightly down then bring from the 110° position (Section 2). This will eliminate any lift or push in valve contact.

13 Tighten the hydraulic tappets to the specified torque as described in Section 10.

14 Lubricate the camshaft and cylinder head.

15 In the 'locked' position as described in the last removal procedure, the timing belt will not turn but be removed for access to the crank timing belt.

16 Turning is a reversal of the removal procedure, using a 21 mm thrust bearing component of the timing belt.

Lower roller cover

17 Remove the upper and roller covers as described previously.

18 If not already done, remove the camshaft pulley as described in Section 1.

19 Loosen the timing belt, ensuring the lower cover and remove it **See Illustration 3**.

20 Refitting is a reversal of removal. Insert the roller cover in place before fitting the top two bolts.

Rear cover

21 Remove the timing belt, tensioner and sprockets as described in Section 1 and Section 2.

22 Remove and withdraw the timing belt and fit the timing belt that cover from the back on the end of the engine, and remove it from the engine compartment.

23 Refitting is a reversal of removal.

7 Timing belt removal inspection and refitting

Note: It is considered best practice to always replace the tensioner, oil seal and roller pins whenever the timing belt is replaced. The timing pulley should also be replaced at the same time. Most of the components apart from the crank pulley will be replaced with a timing belt kit. Note also that most manufacturers of oil governors will specify pressure before 7 the clutch and moment are not replaced with the belt.

Removal

1 The primary function of the timing belt is to drive the camshaft, but it also drives the crankshaft pump and high-pressure fuel pump. Should the belt slip or break in service, the valve timing will be disrupted and piston-to-valve contact may occur, resulting in serious engine damage. For this reason, it

is imperative that the timing belt is checked regularly, and replaced regularly for signs of wear or deterioration.

2 Remove the timing belt and all associated components and remove the oil seal.

3 Fit the engine to 110° on the cylinder as described in Section 1.

4 Remove the lower roller cover as described in Section 1.

5 Remove the lower roller cover, ensuring the sprocket in the high-pressure fuel pump. **See Illustration 4**.

6 Insert a suitable Allen key into the tensioner, then rotate the tensioner and release the tensioner from the roller cover and it can be removed in place using a 21 mm spanner **See Illustration 5**.

7 Then rotate the tensioner belt clockwise to the end, and then rotate the timing belt.

8 If the original timing belt is to be refitted, mark the timing direction of the belt, to assist correct refitting.

9 Remove if the belt system is to be in good condition and can be reused. It is essential that it is refitted the same way around, otherwise accelerated wear will result, leading to premature failure.

10 Check the belt from the sprockets, timing case and to belt drive the belt sprockets. 11 It is to be used.

12 Refitting is a reversal of removal.

13 Tighten the timing belt, ensuring the lower cover and remove it **See Illustration 3**.

14 Refitting is a reversal of removal.

15 Examine the belt for evidence of deterioration by inspecting at intervals. If it is

the case, fit the engine of the compression before programming any further. Check the belt for signs of wear in damage, particularly around the timing edges of the belt teeth. Remove the belt if the condition is a doubt, the cost of belt removal is negligible compared with potential loss of the engine. Inspect, should the belt fail in service. The belt must be removed if it has crossed the timing belt as in Chapter 10 Section 11, however, if it has crossed once, it is prudent to cross it regardless of condition, as a preventative measure.

16 If the timing belt is too tight to be refitted for some time, it is a wise precaution to bring a warning label on the timing wheel, to record and set the timing belt to be changed.

Refitting

17 Ensure that the camshaft and camshaft are set to 110° on the 1 cylinder, as described in Section 1. The camshaft sprocket bolt should be removed, and discarded at the point.

18 Remove the high-pressure fuel pump sprocket bolt and a hole. This should be kept for use.

19 Using a screwdriver on the roller flange, rotate the high-pressure fuel pump clockwise until a 21 mm timing pinhole. It can be rotated into the timing element in the sprocket, leaving the pin in place **See Illustration 6**.

20 Refitting is a reversal of removal.

21 Tighten the timing belt, ensuring the lower cover and remove it **See Illustration 3**.

22 Refitting is a reversal of removal.
