Markedly apart from elementary particle physics another current has been building up and continuously growing within contemporary physics for several decades and even expanding into many other disciplines especially chemistry biology and quite recently economics Several reasons account for this presumably the most important one lies in the fact that whatever the specific problem model or material concerned the same basic mathematical features are always involved In this way a general phenomenology has emerged which unlike thermodynamics is no longer dependent upon the details or specifics what largely prevails is the nonlinear character of the underlying dynamics Perhaps we are witnessing the emergence of a nonlinear physics In a way similar to the birth of quantum physics in the twenties a physics which deals with the general behaviour of systems whatever they are or may be Over the past fifteen years chemical systems evolving sufficiently far from equilibrium have proved to be particularly well fitted to experimental research on nonlinear behaviour oscillation multistability birhythmicity chaotic evolution spatial self organization and hysteresis are displayed by chemical reactions whose number is growing each year In this volume are collected the lectures communications and posters abstracts presented at an international meeting entitled Non Equilibrium Dynamics in Chemical Systems held in Bordeaux France September 3rd 1984 **Arts & Humanities Citation Index** ,1992 A multidisciplinary index covering the journal literature of the arts and humanities It fully covers 1 144 of the world's leading arts and humanities journals and it indexes individually selected relevant items from over 6 800 major science and social science journals **Paperbound Books in**
