DNA-Ligand Interactions W. Guschlbauer, 2013-06-29 This volume contains the texts of the nineteen lectures presented at the NATO ASI FEBS Course on DNA ligand interactions from drugs to proteins The Advanced Study Institute ASI was held from August 30th to September 11th 1986 in the Abbey of Fontevraud France The ASI was attended by 112 participants from a wide scientific horizon and from twentyone different countries It was in some way a follow up of the ASI held in Maratea Italy in May 1981 and which was published in the NATO ASI Life Science series as volume 45 While much has been learned about the way the cellular machinery maintains and transmits the genetic heritage as well as how these processes are regulated little is known about how the interactions between the various partners involved are taking place The interactions of drugs and proteins with nucleic acids are of evident importance in the understanding of these problems The spectacular advances in recombinant DNA technology and the increased sophistication of biophysical techniques in particular x-ray diffraction and nuclear magnetic resonance have created a scientific environment which is highly promising for the future of research in molecular biology These advances permit the serious hope that biology on the molecular level may become a reality Some of the contributions at the ASI presented the most recent advances in this exciting field

Trends in Analysis and Geometry Mohamed A. Khamsi, 2020-01-24 This unique mathematical volume brings together geometers analysts differential equations specialists and graph theorists to provide a glimpse on recent mathematical trends

whose commonalities have hitherto remained for the most part unnoticed The applied mathematician will be pleasantly surprised with the interpretation of a voting system in terms of the fixed points of a mapping given in the book as much as the classical analyst will be enthusiastic to find detailed discussions on the generalization of the notion of metric space in which the metric takes values on an abstract monoid Classical themes on fixed point theory are adapted to the diverse setting of graph theory thus uncovering a set of tools whose power and versatility will be appreciated by mathematicians working on either area The volume also includes recent results on variable exponent spaces which reveal much needed connections with partial differential equations while the incipient field of variational inequalities on manifolds also explored here will be of interest to researchers from a variety of fields
