Create Application Server

Use the Create Application Server wizard. This wizard creates a new application server to run WebSphere applications with dynamic content, enables the WebSphere server configuration for an associated external HTTP server, and creates all necessary database providers and connections required for the WebSphere applications you choose to install.

■ Configured Hosting

An application must be mapped to a host in order to be accessed. Mapping is defined by the host name or IP address, and a port number. By default, the application is configured to be accessible through a default set of hosts defined for the application server. You can set more granular control over network access to your application by configuring the specific hosts.

■ Install Application

Applications must be installed onto the application server to be accessible. The Install New Application wizard takes your action for the application and deploys the application on the server.

■ Setup Database Connection

Many applications need to access databases to retrieve and store data. Database providers and connections are the objects used to let the server how to access the database, what database to access, and where the database is located.
