

Genetics Packet ~ Punnett Square Practice **KEY**

Basics

1. The following pairs of letters represent alleles of different genotypes. Indicate which pairs are **Heterozygous** and which are **Homozygous**. Also indicate whether the homozygous pairs are **Dominant** or **Recessive** (*note heterozygous pairs don't need either dominant nor recessive labels.)

A. BB = Homozygous dominantD. gg = Homozygous recessiveB. Bb = HeterozygousE. aa = Homozygous recessiveC. Gg = HeterozygousF. Ee = Heterozygous

2. In humans, brown eye color (B), is dominant over blue eye color (b). What are the **phenotypes** of the following genotypes?

A. Bb = Brown eyesB. BB = Brown eyesC. bb = blue eyes

Monohybrid Crosses with Complete Dominance

3. A heterozygous smooth pea pod plant is crossed with a wrinkled pea pod plant. There are two alleles for pea pod, smooth and wrinkled. Use R for seed texture. Predict the offspring from this cross.

a. What is the genotype of the parents? Rr x rr

b. Set up a Punnett square with possible gametes.

	R	r
r	Rr	rr
r	Rr	rr

c. Fill in the Punnett square for the resultant offspring.

d. What is the predicted genotypic ratio for the offspring? 1 Rr : 1 rre. What is the predicted phenotypic ratio for the offspring? 1 smooth : 1 wrinkledf. If this cross produced 50 seeds how many would you predict to have a wrinkled pod? 25

4. In humans, achondroplasia "dwarfism" (D) is dominant over normal (d).

A homozygous dominant (DD) person dies before the age of one.

A heterozygous (Dd) person is dwarfed. A homozygous recessive individual is normal.

A heterozygous dwarf man marries a heterozygous dwarf woman...

Theorignofevolutionaryalgorithmwasanattempttomimicsomeoftheprocesses taking place in natural evolution Although the details of biological evolution are not completely understood even nowadays there exist some points supported by strong experimental evidence Evolution is a process operating over chromosomes rather than over organisms The former are organic tools encoding the structure of a living being i e a cr ture is built decoding a set of chromosomes Natural selection is the mechanism that relates chromosomes with the ef ciency of the entity they represent thus allowing that ef cient organism which is we adapted to the environment to reproduce more often than those which are not The evolutionary process takes place during the reproduction stage There exists a large number of reproductive mechanisms in Nature Most common ones are mutation that causes the chromosomes of offspring to be different to those of the parents and recombination that combines the chromosomes of the parents to produce the offspring Based upon the features above the three mentioned models of evolutionary c puting were independently and almost simultaneously developed *Genetic Algorithms and Fuzzy Multiobjective Optimization* Masatoshi Sakawa, 2012-12-06 Since the introduction of genetic algorithms in the 1970s an enormous number of articles together with several significant monographs and books have been published on this methodology As a result genetic algorithms have made a major contribution to optimization adaptation and learning in a wide

variety of unexpected fields Over the years many excellent books in genetic algorithm optimization have been published however they focus mainly on single objective discrete or other hard optimization problems under certainty There appears to be no book that is designed to present genetic algorithms for solving not only single objective but also fuzzy and multiobjective optimization problems in a unified way Genetic Algorithms And Fuzzy Multiobjective Optimization introduces the latest advances in the field of genetic algorithm optimization for 0 1 programming integer programming nonconvex programming and job shop scheduling problems under multiobjectiveness and fuzziness In addition the book treats a wide range of actual real world applications The theoretical material and applications place special stress on interactive decision making aspects of fuzzy multiobjective optimization for human centered systems in most realistic situations when dealing with fuzziness The intended readers of this book are senior undergraduate students graduate students researchers and practitioners in the fields of operations research computer science industrial engineering management science systems engineering and other engineering disciplines that deal with the subjects of multiobjective programming for discrete or other hard optimization problems under fuzziness Real world research applications are used throughout the book to illustrate the presentation These applications are drawn from complex problems Examples include flexible scheduling in a machine center operation planning of district heating and cooling plants and coal purchase planning in an actual electric power plant

Artificial Neural Nets and Genetic Algorithms Rudolf F. Albrecht, Colin R. Reeves, Nigel C. Steele, 2012-12-06 Artificial neural networks and genetic algorithms both are areas of research which have their origins in mathematical models constructed in order to gain understanding of important natural processes By focussing on the process models rather than the processes themselves significant new computational techniques have evolved which have found application in a large number of diverse fields This diversity is reflected in the topics which are the subjects of contributions to this volume There are contributions reporting theoretical developments in the design of neural networks and in the management of their learning In a number of contributions applications to speech recognition tasks control of industrial

processes as well as to credit scoring and so on are reflected Regarding genetic algorithms several methodological papers consider how genetic algorithms can be improved using an experimental approach as well as by hybridizing with other useful techniques such as tabu search The closely related area of classifier systems also receives a significant amount of coverage aiming at better ways for their implementation Further while there are many contributions which explore ways in which genetic algorithms can be applied to real problems nearly all involve some understanding of the context in order to apply the genetic algorithm paradigm more successfully That this can indeed be done is evidenced by the range of applications covered in this volume *Encyclopedia of Artificial Intelligence* Rabuñal Dopico, Juan Ramón, Dorado, Julian, Pazos,

Applications Fatos Xhafa, Ajith Abraham, 2008-08-22 During the past decades scheduling has been among the most studied optimization problems and it is still an active area of research Scheduling appears in many areas of science engineering and industry and takes different forms depending on the restrictions and optimization criteria of the operating environments 8 For instance in optimization and computer science scheduling has been defined as the allocation of tasks to resources over time in order to achieve optimality in one or more objective criteria in an efficient way and in production as production schedule i.e. the planning of the production or the sequence of operations according to which jobs pass through machines and is optimal with respect to certain optimization criteria Although there is a standardized form of stating any scheduling problem namely efficient allocation of jobs on machines which can process no more than one activity at a time with the objective to optimize some objective function of the job completion times scheduling is in fact a family of problems Indeed several parameters intervene in the problem definition a job characteristics preemptive or not precedence constraints release dates etc b resource environment single vs parallel machines unrelated machines identical or uniform machines etc c optimization criteria minimize total tardiness the number of late jobs makespan overtime etc maximize resource utilization etc and d scheduling environment static vs dynamic in the former the number of jobs to be considered and their ready times are available while in the latter the number of jobs and their characteristics change over time AI 2005: Advances in Artificial Intelligence Shichao Zhang, 2005-11-21 This book constitutes the refereed proceedings of the 18th Australian Joint Conference on Artificial Intelligence AI 2005 held in Sydney Australia in December 2005 The 77 revised full papers and 119 revised short papers

presented together with the abstracts of 3 keynote speeches were carefully reviewed and selected from 535 submissions. The papers are categorized in three broad sections namely AI foundations and technologies, computational intelligence, and AI in specialized domains. Particular topics addressed by the papers are logic and reasoning, machine learning, game theory, robotic technology, data mining, neural networks, fuzzy theory, and algorithms, evolutionary computing, Web intelligence, decision making, pattern recognition, agent technology, and AI applications.

An Introduction to Genetic Algorithms Melanie Mitchell, 1998-03-02. Genetic algorithms have been used in science and engineering as adaptive algorithms for solving practical problems and as computational models of natural evolutionary systems. This brief, accessible introduction describes some of the most interesting research in the field and also enables readers to implement and experiment with genetic algorithms on their own. It focuses in depth on a small set of important and interesting topics, particularly in machine learning, scientific modeling, and artificial life, and reviews a broad span of research, including the work of Mitchell and her colleagues. The descriptions of applications and modeling projects stretch beyond the strict boundaries of computer science to include dynamical systems theory, game theory, molecular biology, ecology, evolutionary biology, and population genetics, underscoring the exciting, general-purpose nature of genetic algorithms as search methods that can be employed across disciplines. An Introduction to Genetic Algorithms is accessible to students and researchers in any scientific discipline. It includes many thought and computer exercises that build on and reinforce the reader's understanding of the text. The first chapter introduces genetic algorithms and their terminology and describes two provocative applications in detail. The second and third chapters look at the use of genetic algorithms in machine learning, computer programs, data analysis, and prediction, neural networks, and in scientific models, interactions among learning, evolution, and culture, sexual selection, ecosystems, evolutionary activity. Several approaches to the theory of genetic algorithms are discussed in depth in the fourth chapter. The fifth chapter takes up implementation, and the last chapter poses some currently unanswered questions and surveys prospects for the future of evolutionary computation.

Foundations of Genetic Algorithms 2001 (FOGA 6) Worth Martin, 2001-07-18. Foundations of Genetic Algorithms Volume 6 is the latest in a series of books that records the prestigious Foundations of Genetic Algorithms Workshops, sponsored and organized by the International Society of Genetic Algorithms, specifically to address theoretical publications on genetic algorithms and classifier systems. Genetic algorithms are one of the more successful machine learning methods. Based on the metaphor of natural evolution, a genetic algorithm searches the available information in any given task and seeks the optimum solution by replacing weaker populations with stronger ones. Includes research from academia, government laboratories, and industry. Contains high-calibre papers which have been extensively reviewed. Continues the tradition of presenting not only current theoretical work but also issues that could shape future research in the field. Ideal for researchers in machine learning, specifically those involved with evolutionary computation.
