Mathematical Models for Registration and Applications to Medical Imaging

Otmar Scherzer,2006-10-03 Image registration is an emerging topic in image processing with many applications in medical imaging picture and movie processing The classical problem of image registration is concerned with finding an appropriate transformation between two data sets This fuzzy definition of registration requires a mathematical modeling and in particular a mathematical specification of the terms appropriate transformations and correlation between data sets Depending on the type of application typically Euler rigid plastic elastic deformations are considered The variety of similarity measures ranges from a simple L distance between the pixel values of the data to mutual information or entropy distances This goal of this book is to highlight by some experts in industry and medicine relevant and emerging image registration applications and to show new emerging mathematical technologies in these areas Currently many registration applications are solved based on variational principle requiring sophisticated analysis such as calculus of variations and the theory of partial differential equations to name but a few Due to the numerical complexity of registration problems efficient numerical realizations are required Concepts like multi level solver for partial differential equations non convex optimization and so on play an important role Mathematical and numerical issues in the area of registration are discussed by some of the experts in this volume Moreover the importance of registration for industry and medical imaging is discussed from a medical doctor and from a manufacturer point of view

Mathematical Competencies in the Digital Era Uffe Thomas Jankvist, Eirini Geraniou, 2023-02-20 This book focuses on the potential interplay between two distinct yet related paradigm shifts in mathematics education drawing on the notion of networking of theories through illustrative case studies from the Danish educational system and beyond The first paradigm shift is the massive introduction of digital technology in the teaching and learning of the subject the second is a shift from the traditional focusing on mastering of skills and knowledge to being concerned with the possession and development of mathematical competencies This book builds on the Danish KOM Competencies and the Learning of Mathematics project which sources its description of mathematical mastery primarily on the notion of a mathematical competency rather than on lists of topics concepts and results This allows for an overarching framework which captures the perspectives of mathematics teaching and learning at whichever educational level While the KOM framework does not in detail address the role of digital technologies in relation to its description of different types of mathematical competencies etc the chapters of this book set out to do exactly this while in the process also drawing on a selection of other theoretical constructs and frameworks from mathematics education research Starting with introductory chapters by key researchers in the area the book brings forth chapters for each of the KOM framework's eight mathematical competencies authored by Nordic researchers in combination with international scholars The KOM framework also operates with three types of overview and judgement which are specifically addressed in relation to the role of digital technologies in the third part of the book The fourth and final part of the book broadens the scene and provides chapters of a more perspective nature in relation to mathematical competencies in the digital era The book's preface is by Susanne Prediger
