Erdas Imagine User Guide:

Image Processing and Data Analysis with ERDAS IMAGINE® Stacy A.C. Nelson, Siamak Khorram, 2018-10-03 Remotely sensed data in the form of digital images captured from spaceborne and airborne platforms provide a rich analytical and observational source of information about the current status as well as changes occurring in on and around the Earth's surface. The data products or simply images processed from these platforms provide an additional advantage in that geographic areas or regions of interest can be revisited on a regular cycle. This revisit cycle allows geospatial analysts and natural resource managers to explore changing conditions over time. Image Processing and Data Analysis with ERDAS IMAGINE explains the principles behind the processing of remotely sensed data in a simple, easy-to-understand and how to format. Organized as a step-by-step guide with exercises adapted from original research and using publicly available imagery such as NASA Landsat, ESA Sentinel 2 Orthophotos and others, this book gives readers the ability to quickly gain the practical experience needed to navigate the ERDAS IMAGINE software as well as learn certain applications in Esri's ArcMap, ArcGIS for Desktop software and Quantum GIS (QGIS) open source applications package. It also helps readers to easily move beyond the information presented in this book and tackle more advanced skills. Written by two professors with long experience in remote sensing and image processing, this book is a useful guide and reference for both undergraduate and graduate students, researchers, instructors, managers and agency professionals who are involved in the study of Earth systems and the environment.

Geographic Information Science for Land Resource Management Suraj Kumar Singh, Shruti Kanga, Gowhar Meraj, Majid Farooq, Sudhanshu, 2021-06-15 Geographic Information Science for Land Resource Management is a comprehensive book focusing on managing land resources using innovative techniques of spatial information sciences and satellite remote sensing. The enormous stress on the land resources over the years due to anthropogenic activities for commercialization and livelihood needs has increased manifold. The only solution to this problem lies in stakeholder awareness, which can only be attained through scientific means. The awareness is the basis of the sustainable development concept, which involves optimal management of natural resources subject to the availability of reliable, accurate and timely information from the global to local scales. GIScience consists of satellite remote sensing (RS), Geographical Information System (GIS) and Global Positioning System (GPS) technology that is nowadays a backbone of environmental protection, natural resource management and sustainable development and planning. Being a powerful and proficient tool for mapping, monitoring, modeling and managing natural resources can help understand the earth surface and its dynamics at different observational scales. Through the spatial understanding of land resources, policymakers can make prudent decisions to restore and conserve critically endangered resources such as water bodies, lakes, rivers, air, forests, wildlife, biodiversity etc. This innovative new volume contains chapters from eminent researchers and experts. The primary focus of this book is to replenish the gap in the available literature on the subject by bringing the concepts, theories and

experiences of the specialists and professionals in this field jointly The editors have worked hard to get the best literature in this field in a book form to help the students researchers and policymakers develop a complete understanding of the land system vulnerabilities and solutions

Spatial Analysis Paul A. Longley, Michael Batty, 1997-04-17 Spatial Analysis Modelling in a GIS Environment Edited by Paul Longley and Michael Batty Digital data and information are used increasingly by academics professionals local authorities and government departments Powerful new technologies such as geographic information systems GIS are being developed to analyse such data and GIS technologies are rapidly becoming part of the emergent world digital infrastructure This book shows how computer methods of analysis and modelling built around GIS can be used to identify ways in which our cities and regions might be better planned and understood The contributors to this book are all actively involved in research using geographic information systems This book will be valuable reading for Geographers researchers and regional analysts Population theorists and regional economists with interests in large scale demographic and employment data Planners and policy makers who wish to use GIS to improve their decision making Business analysts who wish to explore markets using the most recent advances in digital spatial data technology All those interested in geodemographics Paul Longley is Professor of Geography at the Department of Geography University of Bristol United Kingdom Michael Batty is Professor of Spatial Analysis and Planning at the University College London United Kingdom
