Publications Dargan Bullivant Associates,Construction Industry Research and Information Association,1968 *Learning from Construction Failures* Peter Campbell,2001-12-28 Much of the knowledge used to design build and operate engineered facilities and products is gained by learning from failures As catastrophic building failures become ever more costly this book helps readers understand key issues from determining the causes of failure and isolating failed parts to lessening personal liability through proper contracting planning and management **Structural Design in Building Conservation** Dimitris

Theodossopoulos,2012-07-26 No building is properly conserved if it is not structurally sound Consequently architects engineers and conservation officers need an adequate grounding in the technology the materials and the historic origins of the building in order to complete a conservation project successfully Structural Design in Building Conservation deals with design issues and technical choices showing how they are integrated with the planning and architectural outcomes in a conservation project It brings together theory with current conservation technology discussing the possibilities of structural details and strategies in architectural expression Case studies are central to this and these are organised around such themes as the addition of roofs requalification of space strengthening and re use of fabric repristination additions completions stiffness adjustments and the correction of past mistakes The reader is encouraged to examine the technical details of these real projects and explore the possible solutions The philosophy of structural interventions is introduced in the context of conservation theories and practices in various European countries The main types of strengthening repairs and

interventions are explained using different building types and the structural nature of the main elements to be strengthened linear structures frames plates and shells is explored in detail Case studies included cover a very wide range of historic types and conversions not only monumental masonry structures like neoclassical buildings major temples churches public buildings and museums but also more utilitarian structures like historic mills early reinforced concrete structures and vaulting types This is essential reading for all students of architectural conservation and practicing architects and engineers who are involved in conservation projects

The Structural Engineer, 2006 FRP Reinforcement in RC Structures fib Fédération internationale du béton, 2007-01-01 fib Bulletin 40 deals mainly with the use of FRP bars as internal reinforcement for concrete structures The background of the main physical and mechanical properties of FRP reinforcing bars is presented with special emphasis on durability aspects For each of the typical ultimate and serviceability limit states the basic mechanical model is given followed by different design models according to existing codes or design guidelines Composite FRP materials are still relatively new in construction and most engineers are unfamiliar with their properties and characteristics The second chapter of this bulletin therefore aims to provide practising engineers with the necessary background knowledge in this field and also presents typical products currently available in the international market The third chapter deals with the issue of durability and identifies the parameters that can lead to deterioration which is necessary information when addressing design issues A series of parameters is used to identify the allowable stress in the FRP after exposure for a specified period of time in a specific environment The bulletin covers the issues of Ultimate Limit States primarily dealing with flexural design Serviceability Limit States dealing with deflections and cracking Shear and Punching Shear and Bond and Tension Stiffening It provides not only the state of the art but also in many cases ideas for the next generation of design guidelines The final chapter deals with the fundamental issue of design philosophy The use of these new materials as concrete reinforcement has forced researchers to re think many of the fundamental principles used until now in RC design The bulletin ends with a discussion of a possible new framework for developing partial safety factors to ensure specific safety levels that will be flexible enough to cope with new materials

Proceedings of the Institution of Civil Engineers, 2007 Coastal Engineering Dominic Reeve, Andrew Chadwick, Christopher Fleming, 2018-03-09 Effective coastal engineering is expensive but it is not as costly as neglect or ineffective intervention Good practice needs to be based on sound principles but theoretical work and modelling also need to be well grounded in practice which is continuously evolving Conceptual and

detailed design has been advanced by new industry publications since the publication of the second edition This third edition provides a number of updates the sections on wave overtopping have been updated to reflect changes brought in with the recently issued EurOtop II manual a detailed worked example is given of the calculation of extreme wave conditions for design additional examples have been included on the reliability of structures and probabilistic design the method for tidal analysis and calculation of amplitudes and phases of harmonic constituents from water level time series has been introduced in a new appendix together with a worked example of harmonic analysis and a real life example is included of a design adapting to climate change This book is especially useful as an information source for undergraduates and engineering MSc students specializing in coastal engineering and management Readers require a good grounding in basic fluid mechanics or engineering hydraulics and some familiarity with elementary statistical concepts
