For the design the construction of highway and airfield, it is imperative to carry out tests on construction materials for their scientific designing and cost-minimum. The inherent economy in construction depends upon the maximum use of local materials. The prime objective of the different tests is to know and classify the processed material into different group depending upon their physical and strength or stability characteristics.

Different types of permeants are investigated, all made for the sole and immediate convenience of various types of rubbers in the market. In all these permeants are laid over a prepared soil surface sealed with asphalt. It is necessary first to test the properties of the subgrade soil and to select the permeant in respect to the above-mentioned conditions, before taking up the design and construction of the permeant. The basic tests needed on the subgrade soil for this purpose are for the classification and identification of the soil, its density and composition characteristics. It is also necessary to determine the strength characteristics of the subgrade for the design of permeants. Some of the important tests on subgrade soil are given in Part II of this book.

Parameters are classified into two major groups as *facilitative* and *rigid*. The parameter sections which do not fall in any one of these types, are being classified as *semi-rigid* or *semi-facilitative*. Depending upon the technique and the material of construction, the parameters are divided into three broad categories: (a) *Structural* (all Concrete, masonry and steel), (b) *Material* (all Wood, Metal and Plastic), and (c) *Behavioral* (all Composite and wood). The study of road stones are judged by studying their resistance against abrasion, crushing, and weathering action. The other properties of aggregates which are important are their shape factor, specific gravity, water absorption, relative efficiency with bitumen, etc. The important tests on aggregates for use as pavement material have been presented in Part II of this book.

In preparing this document, the aggregates are listed together in a prominent component type with binding agents in the category of miscellaneous materials. The various types of binders and the various types of aggregates are listed in the miscellaneous materials section. The use of these materials for concrete, highways and airports has increased quite rapidly during the last few decades. With fast developing petroleum industry in India, more bituminous materials would be available for utilization. Physical tests like penetration, ductility, softening point, flash point etc., are in use in classifying and testing of bituminous materials. Viscosity test is also included in recent years for defining the materials for their asphaltic use. Part III of this book deals with some bituminous materials.

Interimment systems are used in the traffic course of pavements, some types of Interimment system are also used in the base course of some flexible pavements. These paving mixes are to be designed to withstand the varying conditions of climate and traffic. There are several methods of Interimment mix design. Two of the more common methods are given in Part IV of the book.

There are several important caveats which are not included as they were not consistently dealt within current assessment technology through many standard publications.

Below are the tests as well, separately. Numerous materials and items are standardized in different manners by different organizations. The test methods, results and specifications in this book are based on those given by the British Standards Institution (BSI) and the Indian Bureau of Certification (BIS). However in the case of tests not covered by the BSI or BIS, the specification and measurement of values standard organizations (like the British Standards Institution, American Society for Testing Materials, Applied Electronics, etc.) have been followed.

Preface to the first edition

Different educational institutions in India have now developed their syllabi wherein testing of highway materials have been included. Hence an urgent need of suitable laboratory manual has been felt. This book though particularly designed for engineering students, deals with the routine tests that the field engineers engaged in paving jobs may also need to know too.

In preparing this manual, authors have extensively used the publications of ICA, ILO, AETM, and Alpha Institute. The help received from these organizations is therefore gratefully acknowledged here.
