

- Dermal cells protect the plant and controls interactions with the environment – found on outer surface of stems and leaves
- Ground cells make up rest of the internal plant structure, specialised for food storage, structural support and photosynthesis.

• NUTRIENT AND GAS REQUIREMENTS

Autotrophs

- Organisms that can make their own food from inorganic substances
- E.g. plants

Heterotrophs

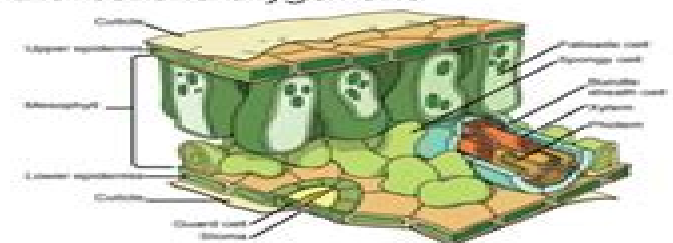

- Organisms that cannot make their own organic food so need to consume other organisms to obtain these
- E.g. humans and other animals

Leaf structure

- Plants require light and carbon dioxide for photosynthesis
- Leaves are main sites of photosynthesis
- Leaf shape is a balancing act between light capture and water loss, and it varies depending on the environment of the plant.

Tissues of leaf

- Cuticle - waxy layer over epidermis – reduces water loss
- Epidermis - cells on upper and lower layer of leaf – cells fit closely together to reduce evaporation and keep pathogens out
- Stomates are openings in the epidermis. Consists of two guard cells and a pore that opens and closes. Carbon dioxide diffuses into the leaf and oxygen and water vapour exit the leaf via the stomatal pores. Water availability and light affect the opening and closing of stomates.
- Mesophyll tissues lie between the upper and lower epidermal cell layers. Cells contain chloroplasts. Upper layer is palisade mesophyll (palisade = fence). Lower layer is spongy mesophyll with air spaces for exchange of gases.

Stomatal opening and closing

- Guard cells can control opening and closing of stoma
- In dry and hot environments plant could dehydrate and die if it is unable to close the stomates to stop water loss via transpiration
