

PUBERTY AND CLIMACTERIC

ENDOCRINE CONTROL OF PUBERTY

Reproductive function is controlled by **hormonal links** between the hypothalamus and pituitary from childhood to adulthood. The first symptoms of puberty is the enlargement of the testes. FSH induces sustentacular cells to secrete **gonado-stimulating hormone**, and LH is often referred to as **interstitial cell-stimulating hormone (ICSH)**.

AGING AND SEXUAL FUNCTION

Testosterone secretion peaks at about **1 mg/day** at age 20 and declines by age 60. There is a corresponding decline in the number and activity of spermatocytes existing in the interstitial cells. As testosterone and testin levels decline, so does the feedback inhibition of the pituitary. FSH and LH levels **rise** after age 50 and produce changes called **male climacteric** - few have noted changes, hot flashes, and rhotions of pubescence because of this.

MEIOSIS

MEIOSIS I	MEIOSIS II
EARLY PROPHASE I - Chromatin condenses to form visible chromosomes; each chromosome has 2 chromatids joined by a centromere. MID TO LATE PROPHASE I - Homologous chromosomes form pairs called tetrads. Chromatids often break and exchange segments (crossing over). Centrioles produce spindle fibers. Nucleus envelope disappears. METAPHASE I - Tetrads align on equatorial plane of cell with centrioles attached to spindle fibers.	PROPHASE II - Nuclear envelopes disintegrate; again, chromosomes still consist of 2 chromatids. Spindle forms. METAPHASE II - Chromosomes align on equatorial plane. ANAPHASE II - Centromeres divide; sister chromatids migrate to opposite poles of cell. Each chromatid now constitutes a single-stranded chromosome.
