

## Relationships and Biodiversity Lab

### Introduction:

In this lab you will perform a number of tests to determine evolutionary relationships between a very important (but endangered) plant species, *Betula carnea* and three related plant species (A, Y and Z).

### Scenario:

*Betula carnea* is a very valuable plant species because it produces **Cureol**, a certain type of compound used for treating cancer. Cureol cannot be produced in the laboratory. *Betula carnea* grows very slowly and is on the endangered species list so it is unable to produce large quantities of Cureol. There are three other plant species (A, Y and Z) related to *Betula carnea* that are not endangered. The species that is most closely related to *Betula carnea* is most likely to serve as a source for the important compound Cureol and help to cure cancer. Your job is to determine which species is the most closely related to the endangered species *Betula carnea* and therefore the most likely to be used as a source for the important compound Cureol.

### Lab Activity Tests 1-3:

#### Test 1: Structural Characteristics of Plants

- Compare the structural characteristics of the plant samples. Record your observations in Table 1.

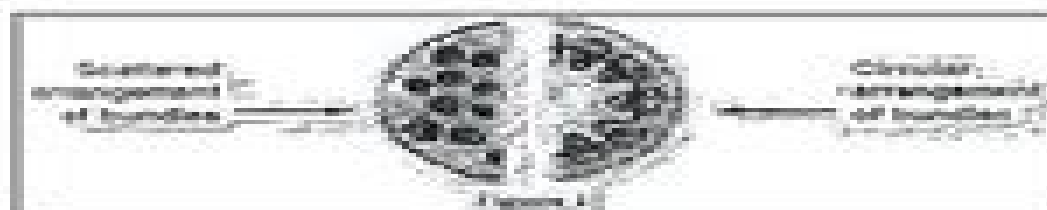

#### Test 2: Structural Characteristics of Seeds

- Compare the structural characteristics of the seed samples. Record your observations in Table 2.

#### Test 3: Microscope Internal Structure of Stems

- Compare the internal structure of the stem samples. Determine whether the bundles of conducting tissues are scattered (see below) or arranged in a circular pattern (see below).

in Table 3.

draw an  
on circular  
diagram  
Record your  
observations.

### Hypotheses: Tests 1-3

- a. Based on your data for structural relationships, which species (A, Y or Z) would you hypothesize is most likely to produce the compound Cureol?
- b. Explain how the data you collected supports your hypothesis. You will confirm your hypothesis with further tests.

Collins, G. Philip Robertson, Michael J. Klug, 2012-12-06 The sustainability of both natural and managed ecosystems is strongly influenced by soil biological processes A major question in soil biology and ecosystem ecology is the extent to which these processes are affected by the function and structure of the soil's biotic community The Significance and Regulation of Soil Biodiversity presents the discussions of a group of soil biologists and ecosystem ecologists in which they synthesize available information present innovative methodologies and develop cross taxa and cross habitat collaborations to advance our understanding of soil biodiversity The volume addresses the extent and regulation of soil biodiversity and describes initial approaches to the linking of soil biodiversity and ecosystem function Audience Researchers and students in a wide range of environmental scientific disciplines **Biodiversity of Fungi** Sunil K. Deshmukh, M. K. Rai, 2005 Fungi are the largest group among living organisms after insects The total fungal species is estimated to be 1.5 million of which 72,000 have been reported and 1500 are added every year Fungi are used in various biotechnological applications such as in the pharmaceutical and agrochemical industries in bioremediation biological control as natural scavengers for recycling of elements dyes etc This book attempts to cover the various aspects of fungi This book will add substantially to the knowledge of fungal diversity and its applications in specific areas and bring the information under one umbrella Human-Computer Interaction.
