**Abstract:** The purpose of this study was to utilize the strengths of stronger students, in order to facilitate the example annotation process and ensure the quality of the annotations. The system presented in this study, AnnotEx, offers a focused way to integrate the Peer Review Model in example annotation and can be extended to meet advanced educational purposes. The results confirm that modeling the peer review when annotating examples guarantees the quality and efficiency of the annotations.

**Keywords:** Peer reviews, example annotating, example-based learning.

## Introduction

In traditional e-learning environments, students are passive consumers and teachers are creators of educational content. However, the lack of content has encouraged a number of researchers to explore the idea of using students as creators rather than consumers of the content (Arroyo, 2003; Hsiao & Brusilovsky, 2007). Several studies demonstrated that this approach works really well; not only the students were able to produce content that was useful for their peers, but they also learned a lot in this process. For example, Jonassen and Reeves (1996) demonstrated that students are likely to learn more by constructing hypermedia instructional materials than by studying hypermedia created by others. Similarly, Hundhausen and Douglas (2000) argued that students can learn more by constructing algorithm animations than by watching animations contracted by experts.

As shown by several authors, student collaboration in the process of content authoring is critical for producing quality content. This collaboration can be both direct and indirect (in the form of peer reviewing). For example, Animal Watch Web-based Environment (AWE) engages student authors in content-creation and allows students to collaborate with each other to produce comments, which enhance the content of the system (Arroyo, 2003). The study confirms that students are willing to author the content, while still enjoying the benefits of the ITS as a student. In our previous studies (Hsiao & Brusilovsky, 2007; Hsiao, 2008), we explored the value of peer reviewing for creating quality educational content. We used Example Annotator system (AnnotEx), which supported collaborative authoring and peer-reviewing. The system was designed to increase the likelihood of example self-explanation and to provide collaborative learning opportunity through raising questions and creating the opportunity to collect peers perspectives. Both cases contribute to personal learning experience.

While earlier studies with AnnotEx demonstrated the value of peer reviewing process, the question of how to organize the peer reviewing process so that its benefits can be maximized was still not answered. One of the research questions explored in this study is whether the value of peer review could be increased if we pair students with strong and weak knowledge of the subject. In our past studies we observed that both quality of

**Social Research Methods by Example** Yasemin Besen-Cassino, Dan Cassino, 2017-07-06 Social Research Methods by Example shows students how researchers carry out work on the cutting edge of social science. The authors illustrate every point through engaging thought provoking examples from real research. The language is jargon free making research methods less intimidating and more relatable. The text is divided into three major sections the first of which introduces students to the principles of research through examples from various fields. The second section walks students through the major types of social science research with each chapter focusing on a different technique. The third section shows students how to carry out basic quantitative data analysis in SPSS. The final chapter shows how technological advances have changed the way researchers are working and looks at the direction of social science research in the future. Social Research Methods by Example not only introduces students to the principles of social science research but gives them a toolbox to carry out their own. By the time they are finished with the book students will be conversant with many of the most important studies in the history of social science. They will understand not only how to conduct research but also how the field has evolved over time.

This Research Topic in Frontiers in Computational Neuroscience collects visions for a future system of open evaluation. Because critical arguments about the current system abound, these papers will focus on constructive ideas and comprehensive designs for open evaluation systems. Design decisions include: Should the reviews and ratings be entirely transparent or should some aspects be kept secret? Should other information such as paper downloads be included in the evaluation? How can scientific objectivity be strengthened and political motivations weakened in the future system? Should the system include signed and authenticated reviews and ratings? Should the evaluation be an ongoing process such that promising papers are more deeply evaluated? How can we bring science and statistics to the evaluation process, e.g., should rating averages come with error bars? How should the evaluative information about each paper, e.g., peer ratings, be combined to prioritize the literature? Should different individuals and organizations be able to define their own evaluation formulae, e.g., weighting ratings according to different criteria? How can we efficiently transition toward the future system? Ideally, the future system will derive its authority from a scientific literature on community-based open evaluation. We hope that these papers will provide a starting point.
