**The Ethics of Climate Change** Byron Williston, 2023-08-24 The Ethics of Climate Change An Introduction systematically and comprehensively examines the ethical issues surrounding arguably the greatest threat now facing humanity This second edition has been updated and includes two new chapters on climate change and capitalism and climate change and law Williston addresses important questions such as Has humanity entered the Anthropocene epoch Is climate change primarily an ethical or an economic issue Can capitalism be reformed to prevent climate catastrophe What are the moral failings of international climate diplomacy What are the main causes of political inaction and climate denial Should tort law be used to sue those responsible for climate change What are intragenerational and intergenerational justice Is geoengineering an ethically justifiable response to climate change Featuring case studies throughout this textbook provides a philosophical introduction to an immensely topical issue studied by students within the fields of applied ethics global justice sustainability geography and politics      **Systemic Management** Charles W. Fowler, 2009-03-26 Systemic management describes a holistic objective and universally applicable form of management providing a framework for addressing environmental challenges such as global warming emergent diseases deforestation overpopulation the extinction crisis pollution over fishing and habitat destruction Its goals are the consistently sustainable relationships between humans and ecosystems between humans and other species and between humans and the biosphere This book presents a convincing argument that these goals and the means to achieve them can be inferred from empirical information It describes how comparisons between humans and other species reveal patterns that can serve to guide management toward true sustainability i e ways that are empirically observed to work in natural systems This objective approach has rarely been

possible in conventional management because sustainability is invariably undermined by conflicting human values. Systemic management is presented as a specialized process of pattern based decision making that avoids the inconsistency, subjectivity and error in current management practice. It clearly demonstrates how mimicking nature's empirical examples of sustainability can circumvent anthropocentric tendencies to overuse/misuse human values in management and illustrates the science best suited for achieving sustainability through examples of research that address specific management questions.

**Indigenous Practice and Community-Led Climate Change Solutions** Rani Muthukrishnan, Ranjan Datta, 2023-12-01  
This book centers Indigenous knowledge and practice in community led climate change solutions. This book will be one of the first academic books to use the consciousness framework to examine and explain humans' situatedness and role in maintaining ecosystems' health. Drawing on teachings from the Indigenous Adi Shaiva community, the authors present up to date research on meanings and implications of South Asian traditional cosmic knowledge which focuses on relationality and spirituality connected to climate change. This knowledge can create innovative climate change solutions in areas including land/water traditional management, sustainability goals and expectations and state development projects. Overall, this book provides an innovative framework for nonviolent climate solutions which has its foundations in a traditional cosmic and consciousness based context. This book, which aims to bridge the gap between Indigenous and Western perspectives by re-educating researchers and decolonizing popular climate change solutions, will be of great interest to students and scholars studying climate change, conservation, environmental anthropology and Indigenous studies on a broader scale.

**People and Environment** Gareth Jones, 2014-06-11  
People and Physical Environment: A Global Approach provides an introduction to the main areas of environmental concern for geographers, environmental scientists and planners at the beginning of the twenty first century. These include Pollution of the atmosphere and its impact on our climate, The exploitation of the oceans, Management and supply of fresh water, Degradation of the land and Biodiversity and the need to maintain genetic diversity. The book argues that our knowledge and understanding of the environment is now so great that we can predict with considerable accuracy where the skills of science and technology need to be focussed in order to prevent severe environmental damage from occurring. Achieving successful management of the environment has become dependent upon active participation of a society prepared to pay for a high quality of life and the willingness of our elected politicians to legislate and enforce the very highest standards of environmental management. This book will be essential reading for students of geography, environmental studies, science and land use planners and will also contribute valuable information for climatologists, biogeographers, hydrologists, land economists and forestry students.
