Surabian, Maximillian Ashwill, Saleema Vellani, Yasuo Konishi, 2021-12-16 Interestingly some relief from today's woes may come from ancient human practices While current agri food production models rely on abundant supplies of water energy and arable land and generate significant greenhouse gas emissions in addition to forest and biodiversity loss past practices point toward more affordable and sustainable paths Different forms of insect farming and soilless crop farming or hydroponics have existed for centuries In this report the authors make a persuasive case that frontier agriculture particularly insect and hydroponic farming can complement conventional agriculture Both technologies reuse society's agricultural and organic industrial waste to produce nutritious food and animal feed without continuing to deplete the planet's land and water resources thereby converting the world's wasteful linear food economy into a sustainable circular food economy As the report shows insect and hydroponic farming can create jobs diversify livelihoods improve nutrition and provide many other benefits in African and fragile conflict affected countries Together with other investments in climate smart agriculture such as trees on farms alternate wetting and drying rice systems conservation agriculture and sustainable livestock these technologies are part of a promising menu of solutions that can help countries move their land food water and agriculture systems toward greater sustainability and reduced emissions This is a key consideration as the World Bank renews its commitment to support countries climate action plans This book is the Bank's first attempt to look at insect and hydroponic farming as possible solutions to the world's climate and food and nutrition security crisis and may represent a new chapter in the Bank's evolving efforts to help feed and sustain the planet **Hydroponics, Nutrient Film Techniques** Henry
