

Notice that this summary condenses a seven-page paper and translates it into a cogent and clear synopsis. Note the **absence** of technical jargon, direct quotations and dense sentences. The student has distilled this paper down into clear statements of the main purpose of the study, experimental method, main findings and interpretation of the results. If you can summarize the main points of your paper clearly and **in your own words**, it demonstrates actual understanding of the content of the study. (Be aware that it is very obvious to the reader when you have little to no understanding of the main points of the paper you chose to critique!) If you cannot write a clear summary, you absolutely cannot begin to critique the paper.

Kinehcep, N.A. 1982. Ability of some gastropod egg capsules to protect against low-salinity stress. J. Exp. Marine Biol. Ecol. 63: 195-208.

The fertilized eggs of marine snails are often enclosed in complex, leathery egg capsules with 30 or more embryos being confined within each capsule. The embryos develop for 1 or more weeks before leaving the capsules. The egg capsules of intertidal species potentially expose the developing embryos to thermal stress, osmotic stress, and dessication stress. This paper (Kinehcep, 1982) describes the ability of such egg capsules to protect developing embryos from low-salinity stress, such as might be experienced at low tide during a rainstorm.

Two snail species were studied: *Nucella lamellosa* and *N. lima*. Embryos were exposed at 10-12°C either to full-strength seawater (control conditions) or to 10-12‰ seawater solutions (seawater diluted with distilled water). The ability of egg capsules to protect the enclosed embryos from low-salinity stress was assessed by placing intact egg capsules into the test solutions for up to 9h, returning the capsules to full-strength seawater, and comparing subsequent embryonic mortality with that shown by embryos removed from capsules and exposed to the low-salinity stress directly. Encapsulated embryos exposed to the low salinities suffered less than 2% mortality, even after low-salinity exposures of 9h duration. In contrast, embryos exposed directly to the same test conditions for as little as 5h suffered 100% mortality. All embryos survived exposure to control conditions for the full 9h, showing that removal from the capsules was not the stress killing the embryos in the other treatments. Sampling capsular fluid at various times after capsules were transferred to the diluted seawater. Kinehcep found that the concentration of solutes within capsules fell to near that of the surrounding water within about 1h after transfer.

This study clearly demonstrates the protective value of the egg capsules of 2 snail species faced with low-salinity stress. **However, Kinehcep was unable to explain how** egg capsules of these 2 species protect the
