5. Rose plants produce large, attractive bisexual flowers but they seldom produce fruits. On the other hand, a tomato plant produces plenty of fruits though they have small flowers. Analyse the reasons for the failure of fruit formation in rose.

Both these plants - rose and tomato - both selected by human beings for different characteristics, the rose for its flower and tomato for its fruit. Roses, being vegetative propagated do not need to produce seeds.

Solution:

Rose plants produce large, attractive bisexual flowers but they seldom produce fruits. On the other hand, a tomato plant produces plenty of fruits though they have small flowers. Because

1. The pollens produced by the rose plants may not be viable that means they may not have the compatibility to germinate; hence fertilization does not take place.
2. Pollen-pistil interaction may not take place
3. As the rose plants are hybrid the mitotic division in them may be abnormal, which may produce non-viable gametes.
4. A barrier is present in the pollen tube where the male gametes are restricted to reach the ovule.
