

1. Complete these definitions or ideas that are central to understanding the Hardy-Weinberg theorem.
 - a. Population: A group of individuals of the same species that live in the same area and interbreed to produce fertile offspring
 - b. Gene pool: The total aggregate of all the alleles for all of the loci for all of the individuals in a population
 - c. Genetic drift:
 - d. Allele frequency:
 - e. Genotype:
 - f. Phenotype:
2. Suppose that there is a population of plants that have flower color that is controlled by one gene. Where R is completely dominant and codes for a red flower over r is recessive and encodes a white flower.

A flower that is heterozygous will have a genotype of Rr and a phenotype of RED
3. Consider the example of the medium ground finch (*Geospiza fortis*), a seed-eating bird that lives on the Galápagos Islands. In 1977, the *G. spiza* population endured a long period of drought. Of 1200 birds, only 180 survived. The surviving finches had larger, deeper beaks than the finches that died. Soft, small seeds were in short supply during the drought. Large, hard seeds were more abundant. Finches with large, deep beaks could crack the large seeds and thus were able to survive the food shortage during the drought.

A common misconception is that individual organisms evolve over their lifetimes. However, evolution is the changes in the population overtime.

 - a. Natural selection does act on individuals. Explain how individuals did not evolve and natural selection acted on the individual finches in the example above.

Individual finches did not evolve. Each bird had a beak of a particular size, which did not grow larger during the drought.
 - b. Explain how the finch population evolved from one generation to the next in the example above.

The proportion of birds with large beaks in the population increased from generation to generation because birds with large beaks were better able to survive the drought and reproduce successfully
4. In this chapter we discuss changes in allele frequencies in a population from one generation to the next. This type of evolution is called MICRO EVOLUTION
5. There are three (3) mechanisms that can change allele frequencies in a population. State them below.
 - a. Natural Selection
 - b. Genetic Drift
 - c. Gene flow

Population Biology Alan Hastings, 2013-03-14 Population biology has been investigated quantitatively for many decades resulting in a rich body of scientific literature Ecologists often avoid this literature put off by its apparently formidable mathematics This textbook provides an introduction to the biology and ecology of populations by emphasizing the roles of simple mathematical models in explaining the growth and behavior of populations The author only assumes acquaintance with elementary calculus and provides tutorial explanations where needed to develop mathematical concepts Examples problems extensive marginal notes and numerous graphs enhance the book's value to students in classes ranging from population biology and population ecology to mathematical biology and mathematical ecology The book will also be useful as a supplement to introductory courses in ecology

Differential Evolution Anyong Qing, 2009-07-23 Differential evolution is a very simple but very powerful stochastic optimizer Since its inception it has proved very efficient and robust in function optimization and has been applied to solve problems in many scientific and engineering fields In Differential Evolution Dr Qing begins with an overview of optimization followed by a state of the art review of differential evolution including its fundamentals and up to date advances He goes on to explore the relationship between differential evolution strategies intrinsic control parameters non intrinsic control parameters and problem features through a parametric study Findings and recommendations on the selection of strategies and intrinsic control parameter values are presented Lastly after an introductory review of reported applications in electrical and electronic engineering fields different research groups demonstrate how the methods can be

Evolutionary Conservation Biology Régis Ferrière, Ulf Dieckmann, Denis Couvet, 2004-06-10 As anthropogenic environmental changes spread and intensify across the planet conservation biologists have to analyze dynamics at large spatial and temporal scales Ecological and evolutionary processes are then closely intertwined In particular evolutionary responses to anthropogenic environmental change can be so fast and pronounced that conservation biology can no longer afford to ignore them To tackle this challenge areas of conservation biology that are disparate ought to be integrated into a unified framework Bringing together conservation genetics demography and ecology this book introduces evolutionary conservation biology as an integrative approach to managing species in conjunction with ecological interactions and evolutionary processes Which characteristics of species and which features of environmental change foster or hinder evolutionary responses in ecological systems How do such responses affect population viability community dynamics and ecosystem functioning Under which conditions will evolutionary responses ameliorate rather than worsen the impact of environmental change
