*Environmental Tracking for Public Health Surveillance* Stanley A. Morain, Amelia Budge, 2012-09-25 Satellite imagery and data are widely used in public health surveillance to provide early warning of disease outbreaks and for averting pandemics. Convergence of these technologies began in the 1970s and has gained wide acceptance in the 21st Century. *Environmental Tracking for Public Health Surveillance* focuses on the expanding use of satellite sensors.

**Earth Science for Civil and Environmental Engineers** Richard E. Jackson, 2019-01-24 This carefully targeted and rigorous new textbook introduces engineering students to the fundamental principles of applied Earth science highlighting how modern soil and rock mechanics, geomorphology, hydrogeology, seismology, and environmental geochemistry affect geotechnical and environmental practice. Key geological topics of engineering relevance including soils and sediments, rocks, groundwater, and geologic hazards are presented in an accessible and engaging way. A broad range of international case studies add real world context and demonstrate practical applications in field and laboratory settings to guide site characterization. End of chapter problems are included for self study and evaluation and supplementary online materials include electronic figures, additional examples, solutions, and guidance on useful software. Featuring a detailed glossary introducing key terminology, this text requires no prior geological training and is essential reading for senior undergraduate or graduate students in civil, geological, geotechnical, and geoenvironmental engineering. It is also a useful reference and bridge for Earth science graduates embarking on engineering geology courses.

Stochastic Water Demand Modelling Mirjam Blokker, 2011-09-19 Water quality processes in the drinking water distribution network are strongly influenced by the flow velocity and residence time of the water in the network. In order to understand how the water quality changes in the drinking water distribution network, a good understanding of hydraulics is required. Specifically in the periphery of the network where customers are connected, the hydraulics can change rapidly. During the night time the water is almost stagnant and the residence time increases. In the morning when everybody gets up and flushes the toilet and takes a shower, high flow velocities can occur. During the remainder of the day, flow velocities are low. The stochastic end-user model SIMDEUM was developed to simulate water use on a small time scale (1 s) and small spatial scale (per fixture). SIMDEUM enables a good model of flow velocities, residence times, and the connected water quality processes in the water distribution network. *Stochastic Water Demand Modelling: Hydraulics in Water Distribution Networks* describes the requirements of hydraulics in water quality modelling and provides insight into the development of detailed residential and non-residential water demand models. The book illustrates the use of detailed demand models in water quality models with respect to the variation in residence times and the relation with particle accumulation and resuspension. The models are compared to measurements in several real drinking water distribution networks.

**The Coastal Everglades** Daniel L. Childers, Evelyn Gaiser, Laura A. Ogden, 2019-09-25 *The Coastal Everglades* presents a broad overview and synthesis of research on the coastal Everglades, a region that includes Everglades National

Park adjacent managed wetlands and agricultural and urbanizing communities Contributors for this volume are all collaborators on the Florida Coastal Everglades Long Term Ecological Research Program FCE LTER The FCE LTER began in 2000 with a focus on understanding key ecosystem processes in the coastal Everglades while also developing a platform for and linkages to related work conducted by an active and diverse Everglades research community The program is based at Florida International University in Miami but includes scientists and students from numerous other universities as well as staff scientists at key resource management agencies including Everglades National Park and the South Florida Water Management District Though the Everglades landscape spans nearly a third of the State of Florida the focus on the coastal Everglades has allowed the contributors to examine key questions in social ecological science in the context of ongoing restoration initiatives As this book demonstrates the long term research of the FCE LTER has facilitated a better understanding of the roles of sea level rise water management practices urban and agricultural development and other disturbances such as fires and storms on the past and future dynamics of this unique coastal environment By comparing properties of the Everglades with other subtropical and tropical wetlands the book challenges ideas of novelty while revealing properties of ecosystems at the ends of gradients that are often ignored It also provides insights from and encouragement for long term collaborative studies that inform resource management in similarly threatened coastal wetland landscapes

**Subterranean Estuaries** Carlos Rocha, Henry Bokuniewicz, Clare Robinson, Isaac R. Santos, Hannelore Waska, 2023-01-19 Over recent decades it has become widely recognized that water exchange between coastal aquifers and the ocean is an important component of the hydrologic cycle Twenty years have passed since Willard S Moore Moore 1999 introduced the term subterranean estuary STE to identify those zones within coastal aquifers where fresh groundwater mixes with surface saltwater Like open water estuaries STEs regulate the transfer of chemicals to the sea under the seashore by submarine groundwater discharge SGD This subterranean reactive node in the land ocean exchange pathway has a physical even if elusive structure created by a combination of temporally and spatially variable mass transfer across the groundwater ocean interface and dynamic flow processes Many case studies have shown that SGD is a key material link between coastal watersheds and the sea and indeed spatially resolved budgets of radioactive tracers in shelf waters suggest it is the dominant bulk water flux to coastal zones globally Clearly STE outflow as SGD is a large source of biogeochemically active solutes to shelf seas meaning that elemental budgets for these waters have to be revised in order to account for the new input But how Recognizing the global prevalence and potential environmental and societal impact of SGD numerous attempts to quantify chemical inputs into the ocean through this pathway have been published over the past 40 years However the role of the STE in modulating chemical fluxes to coastal waters has been

generally oversimplified making a comprehensive analysis of cause and effect relationships between SGD inputs and ecosystem dynamics merely indicative Unfortunately we still lack a mechanistic understanding of the processes that control the interaction between allochthonous chemical delivery and autochthonous recycling in the STE that drive compositional variability of SGD flows Like that applied to open water estuaries a general practical and theoretical framework is needed one that captures the structure and biogeochemistry of STEs and allows more accurate understanding of the chemical composition of SGD outflows while simultaneously providing for a typological basis that provides solid support for extrapolation of local SGD chemical flux measurements to regional and from these to global scale A comprehensive and critical review of the current state of the art would reveal that progress requires a improved variable density groundwater flow models that provide more accurate predictions and insights into the flow salt transport and mixing dynamics in STEs b quantitative understanding of the physicochemical and temporal drivers of saline groundwater seepage and composition and c better knowledge of the microbial ecology of STEs and links to marine freshwater and terrestrial drivers of STE dynamics Significant research effort has been devoted to addressing these knowledge gaps It is now time to provide a focused synopsis of these efforts We propose a combination of cutting edge original research systematic practice and policy reviews methods and hypothesis and theory articles tied together by a direction setting perspective analysis to generate a comprehensive and accurate scientific foundation supporting environmental managers scientists and other stakeholders to assess SGD feedbacks on coastal ecosystem functioning and resilience and implement successful coastal management policies
