Miller,Charles S. Duris,2013-04-22 This updated introduction to modern numerical analysis is a complete revision of a classic text originally written in Fortran but now featuring the programming language C It focuses on a relatively small number of basic concepts and techniques Many exercises appear throughout the text most with solutions An extensive tutorial explains how to solve problems with C *The Theory of Lie Derivatives and Its Applications* Kentaro Yano,2020-05-21 Differential geometry has become one of the most active areas of math publishing yet a small list of older unofficial classics continues to interest the contemporary generation of mathematicians and students This advanced treatment of topics in differential geometry first published in 1957 was praised as well written by The American Mathematical Monthly and hailed as undoubtedly a valuable addition to the literature Its topics include Spaces with a non vanishing curvature tensor that admit a group of automorphisms of the maximum order Groups of transformations in generalized spaces The study of global properties of the groups of motions in a compact orientable Riemannian space Lie derivatives in an almost complex space For advanced undergraduates and graduate students in mathematics **Intelligent Learning Environments: The Case of Geometry** Jean-Marie Laborde,2012-12-06 This book is a thoroughly revised result updated to mid 1995 of the NATO Advanced Research Workshop on Intelligent Learning Environments the case of geometry held in Grenoble France November 13 16 1989 The main aim of the workshop was to foster exchanges among researchers who were concerned with the design of intelligent learning environments for geometry The problem of student modelling was chosen as a central theme of the workshop insofar as geometry cannot be reduced to procedural knowledge and because the significance of its complexity makes it of interest for intelligent tutoring system ITS development The workshop centred around the following themes modelling the knowledge domain modelling student knowledge design ing didactic interaction and learner control This book contains revised versions of the papers presented at the workshop All of the chapters that follow have been written by participants at the workshop Each formed the basis for a scheduled presentation and discussion Many are suggestive of research directions that will be carried out in the future There are four main issues running through the papers presented in this book knowledge about geometry is not knowledge about the real world and materialization of geometrical objects implies a reification of geometry which is amplified in the case of its implementation in a computer since objects can be manipulated directly and relations are the results of actions Laborde Schumann This aspect is well exemplified by research projects focusing on the design of geometric microworlds Guin Laborde *Applied Probability Models with Optimization Applications* Sheldon M. The History of the Geometry Curriculum in the United States Nathalie Sinclair,2008-02-01 This volume investigates the evolution of the geometry curriculum in the United States over the past 150 years A primary goal is to increase awareness of the shape and nature of the current geometry curriculum by explaining how things have come to be as they are Given the limited access to first hand accounts of the enacted geometry curriculum during the past 150 years the monograph relies on textbooks to provide a record of the implemented curriculum at any given point in time Policy documents can provide insight into the choices made in textbooks by hinting at the issues considered and the recommendations made The monograph is organized in a chronological sequence of notable events leading to discernable changes in thinking about the geometry curriculum over the past century and a half roughly the extent of time during which geometry has been taught in American schools Notable

events include important reports or commissions influential texts new schools of thought and developments in learning technologies These events affected among other things content and aims of the geometry curriculum the nature of mathematical activity as construed by both mathematicians and mathematics educators and the resources students are given for engaging in mathematical activity Before embarking through the notable events it is necessary to consider the big bang of geometry namely the moment in time that shaped the future life of the geometry curriculum This corresponds to the emergence of Euclidean geometry Given its influence on the shape of the geometry curriculum familiarity with the nature of the geometry articulated in Euclid's Elements is essential to understanding the many tensions that surround the school geometry curriculum Several themes emerge over the course of the monograph and include the aims and means of the geometry curriculum the importance of proof in geometry the role of visualization and tactile experiences the fusion between solid and plane geometry the curricular connections between geometry and algebra and the use of motion and continuity The intended audience would include curriculum developers researchers teachers and curriculum supervisors
