*Quantitative Genetics in the Wild* Anne Charmantier, Dany Garant, Loeske E. B. Kruuk, 2014 Although the field of quantitative genetics the study of the genetic basis of variation in quantitative characteristics such as body size or reproductive success is almost 100 years old its application to the study of evolutionary processes in wild populations has expanded greatly over the last few decades During this time the use of wild quantitative genetics has provided insights into a range of important questions in evolutionary ecology ranging from studies conducting research in well established fields such as life history theory behavioural ecology and sexual selection to others addressing relatively new issues such as populations responses to climate change or the process of senescence in natural environments Across these fields there is increasing appreciation of the need to quantify the genetic rather than just the phenotypic basis and diversity of key traits the genetic basis of the associations between traits and the interaction between these genetic effects and the environment This research activity has been fuelled by methodological advances in both molecular genetics and statistics as well as by exciting results emerging from laboratory studies of evolutionary quantitative genetics and the increasing availability of suitable long term datasets collected in natural populations especially in animals *Quantitative Genetics in the Wild* is the first book to synthesize the current level of knowledge in this exciting and rapidly expanding area This comprehensive volume also offers exciting perspectives for future studies in emerging areas including the application of quantitative genetics to plants or arthropods unraveling the molecular basis of variation in quantitative traits or estimating non additive genetic variance Since this book deals with many fundamental questions in evolutionary ecology it should be of interest to graduate post graduate students and academics from a wide array of fields such as animal behaviour ecology evolution and genetics

**ecology of ticks shape the potential for the transmission of zoonotic pathogens.** Agustín Estrada-Peña,Jose De La Fuente,2015-02-24 Ticks are noticeable by the high diversity of pathogens they can transmit most of them with implications in human and animal health Ticks are arachnids meaning that they do not share the biological and ecological features of the mosquitoes and other parasitic Diptera The natural foci of tick borne pathogens may be as large as a continent or be restricted to small portions of a country without apparently too many similar features The life cycle of the ticks involved three developing instars The precise relationships of ticks and their hosts the specific seasonal pattern of activity of ticks and the still poorly known molecular relationships between ticks and the pathogens they can transmit make these vectors a specially fecund field of research Importantly extensive studies on the biological and ecological relationships of ticks and abiotic climate and vegetation conditions have revealed the fine tuning of the ticks and the pathogens they transmit together with the biological effects of host and the driving features by the climate The studies on tick transmitted pathogens have been on the rise in the last years There is a growing interest in understand the somewhat complex relationships between the landscape the climate the vectors and the pathogens because the concerns of spread probably driven by subtle changes in climate and man made alterations of the landscape Studies on Lyme borreliosis are addressing the interesting issue of the relationships between the climate the tick activity patterns and the selection of strains according to the reservoir availability Furthermore the expanding field of habitat suitability modeling has been applied with different degrees of success to

evaluate and quantify the risk of disease transmission In such exponentially growing field revisionary books are clearly welcome additions to the bibliographical tools of researchers It is however necessary the compilation of works devoted to explore the tip of the iceberg in the field of research In this Research Topic we wish to summarize and review the studies on ecology molecular biology and tick host pathogens interactions provided to resolve the important issues of ticks and pathogens We want not only the results obtained by newly developed molecular tools but rigorous reviews of the most recent advances in these issues This Topic will cover aspects of both human and animal health with special interest on zoonoses Aspects of the biology of the ticks as affecting the transmission of pathogens are of special interest in this Topic Studies on ticks of the poorly known family Argasidae as related to their involvement on pathogen transmission are especially welcome We also wish to describe the perspective of the field in the future Finally the presentation of ongoing original works is greatly encouraged
