Hayes, 2018-09-01 What do evolutionary science and contextual behavioral science have in common Edited by David Sloan Wilson and Steven C Hayes this groundbreaking book offers a glimpse into the histories of these two schools of thought and provides a sound rationale for their reintegration Evolutionary science ES provides a unifying theoretical framework for the biological sciences and is increasingly being applied to the human related sciences Meanwhile contextual behavioral science CBS seeks to understand the history and function of human behavior in the context of everyday life where behaviors occur and to influence behavior in a practical sense This volume seeks to integrate these two bodies of knowledge that have developed largely independently In Evolution and Contextual Behavioral Science two renowned experts in their fields argue why ES and CBS are intrinsically linked as well as why their reintegration or reunification is essential The main purpose of this book is to continue to move CBS under the umbrella of ES and to help evolutionary scientists understand how working alongside contextual behavioral scientists can foster both the development of ES principles and their application to practical situations Rather than the sequential relationship that is typically imagined between these two schools of thought this volume envisions a parallel relationship between ES and CBS where science can best influence positive change in the real world

Coevolution William H. Durham, 1991 Charles Darwin's On the Origins of Species had two principal goals to show that species had not been separately created and to show that natural selection had been the main force behind their proliferation and descent from common ancestors In Coevolution the author proposes a powerful new theory of cultural evolution that is of the descent with modification of the shared conceptual systems we call cultures that is parallel in many ways to Darwin's theory of organic evolution The author suggests that a process of cultural selection or preservation by preference driven chiefly by choice or imposition depending on the circumstances has been the main but not exclusive force of cultural change He shows that this process gives rise to five major patterns or modes in which cultural change is at odds with genetic change Each of the five modes is discussed in some detail and its existence confirmed through one or more case studies chosen for their heuristic value the robustness of their data and their broader implications But Coevolution predicts not simply the existence of the five modes of gene culture relations it also predicts their relative importance in the ongoing dynamics of cultural change in particular cases The case studies themselves are lucid and innovative reexaminations of an array of oft pondered anthropological topics plural marriage sickle cell anemia basic color terms adult lactose absorption incest taboos headhunting and cannibalism In a general case the author's goal is to demonstrate that an evolutionary analysis of both genes and culture has much to contribute to our understanding of human diversity particularly behavioral diversity and thus to the resolution of age old questions about nature and nurture genes and culture
