The three controllers achieve closed-loop H_2 norms of 1.04, 0.07 and 0.03, respectively. Construct closed-loop models and compare the gains from road disturbance to y_1, y_2, y_3 for the passive and active systems. Show that all three controllers reduce suspension deflection and body acceleration below the set points.

So far you have designed H_{∞} controllers that meet the performance objectives for the nominal plant discussed earlier. This model is only an approximation of the true situation and you need to make sure performance is maintained in the face of model errors and uncertainties. This is called robust performance. Next you will synthesize design μ controllers that achieve robust performance for the entire family of plant models synthesized with the design function using the structured singular value (μ), $\mu(X)$ or “worst-case” performance ($\mu \rightarrow 0.1$).

Wind Energy Systems Mario Garcia-Sanz, Constantine H. Houppis, 2012-02-02. Presenting the latest developments in the field, Wind Energy Systems: Control Engineering Design offers a novel take on advanced control engineering design techniques for wind turbine applications. The book introduces concurrent quantitative engineering techniques for the design of highly efficient and reliable controllers which can be used to solve the most critical problems of multi megawatt wind energy systems. This book is based on the authors' experience during the last two decades designing commercial multi megawatt wind turbines and control systems for industry leaders including NASA and the European Space Agency. This work is their response to the urgent need for a truly reliable concurrent engineering methodology for the design of advanced control systems. Outlining a roadmap for such a coordinated architecture, the authors consider the links between all aspects of a multi megawatt wind energy project in which the wind turbine and the control system must be cooperatively designed to achieve an optimized, reliable and successful system. Look inside for links to a free download of QFTCT, a new interactive CAD tool for QFT controller design with MATLAB that the authors developed with the European Space Agency. The textbook's big picture insights can help students and practicing engineers control and optimize a wind energy system in which large flexible aerodynamic structures are connected to a demanding variable electrical grid and work automatically under very turbulent and unpredictable environmental conditions. The book covers topics including

robust QFT control aerodynamics mechanical and electrical dynamic modeling economics reliability and efficiency It also addresses standards certification implementation grid integration and power quality as well as environmental and maintenance issues To reinforce understanding the authors present real examples of experimentation with commercial multi megawatt direct drive wind turbines as well as on shore offshore floating and airborne wind turbine applications They also offer a unique in depth exploration of the quantitative feedback theory QFT a proven successful robust control technique for real world applications as well as advanced switching control techniques that help engineers exceed classical linear limitations
