1. 4.72 Concussions and Brain Size. In this exercise, we test for evidence that average brain size is larger in football players who have never had a concussion (*FBNoConcuss*) than in football players with a history of concussions (*FBConcuss*). The data are in *FootballBrain2* where the variable *Hipp* measures brain size as the volume of the hippocampus (in  $\mu\text{L}$ ) for each subject.

- a. Define the parameter(s) for this question, using appropriate notation.

$$\mu_{nc} - \mu_c$$

- b. Write the null and alternative hypotheses in terms of the parameter(s) above.

$$H_0 = \mu_{nc} = \mu_c$$

$$\text{or } H_0 = \mu_{nc} - \mu_c = 0$$

$$H_a = \mu_{nc} > \mu_c$$

$$H_a = \mu_{nc} - \mu_c > 0$$

$$H_a: \mu_{nc} - \mu_c$$

- c. Use *StatKey* to find the value of the relevant sample statistic. Write it using correct notation.

$$\bar{x}_1 - \bar{x}_2 = 724.600$$

- d. Use *StatKey* to find the p-value for your hypotheses. Include a screenshot of the randomization with tail area with your homework submission, and write the p-value here.

$$P\text{-value} = 0.00 = 0.0013 \sim 13\%$$

- e. Interpret the p-value in the terms of random chance, and in the context of brain size and concussions.

We have statistically significant evidence p-value at 0.00. The average brain size is larger in football players who have never had a concussion. (we have a 0.0013% chance of getting a statistic as or more extreme than the one we got - assuming that the null hypothesis is true.)

State the conclusion of the test in context, using nontechnical language. Include wording about the strength of the evidence against  $H_0$ .

Because  $p < .05$ , we reject the null hypothesis and conclude that football players without a concussion have a larger average brain size than football players with a concussion.
