Trends in Neuroimmunology: cross-talk between brain-resident and peripheral immune cells in both health and disease Estela Maris Muñoz,Rajnikant Mishra ,Veronica Martinez Cerdeño,Janina Edith Borgonovo,Shashank Kumar Maurya ,Suryanarayan Biswal,2024-06-26 The functional anatomy of organisms is maintained by the coordination of different systems that often rely on particular interactions between specialized cells and between macromolecules The immune system works with the circulatory and the lymphatic systems to protect most of the organs However some organs are considered immune privileged due to the presence of highly selective and regulated barriers such as the blood brain barrier BBB within the brain The BBB controls periphery brain molecule exchange and prevents immune effector cells from entering the homeostatic brain BBB associated elements such as endothelial cells pericytes astrocytes and microglia potentially can function as antigen presenting cells APC Pathological scenarios that induce dysfunction of the BBB and its associated cells may lead to the infiltration of lymphocytes crossing over from the blood to brain Similarly traumas can also enable B and T lymphocytes to pass bidirectionally between the CNS and the periphery via the meningeal lymphatic vessels which drain into the cervical lymph nodes Research in animals and in humans has revealed that B and T cells are involved in the progression of neurological diseases It has been showed that under particular conditions T cells establish themselves and become resident in the brain T RM cells from where they can either exert beneficial or detrimental effects on brain function Amazing efforts have been made to further comprehend interactions between brain specific cells and peripheral immune cells and especially their roles and impact on the onset progression and eventual resolution of diverse brain pathologies

Epigenetics in the microbiome-host crosstalk: from mechanisms to Therapeutics Chengfei Liu, Wenda Wu, Haoyu Liu, Hui-Xin Liu, Omar Ramos-Lopez, 2025-04-01 Epigenetic modifications allow cells to change gene expression without altering the genetic code by dynamically regulating chromatin accessibility which is controlled by the activity of associated enzymes such as DNA histone methyltransferases and histone acetyltransferases This represents a potent mechanism through which mammalian hosts adapt their transcriptional program to environmental cues Indeed trillions of commensal microbes termed microbiota along with their metabolites and their signaling are environmental stimuli that can direct host health and disease They are being increasingly recognized as a source of epigenetic substrates cofactors and regulators of epigenetic modifying enzymes Recent research has shown that perturbation of microbiota host interactions with pathologies of inflammatory diseases or metabolic syndrome correlated with altered epigenetic patterning Microbiota sensitive epigenetic mechanisms may include synthesizing biological compounds that affect the availability of methyl acetyl donors for DNA or histone modifications modulating epigenetic modifying enzyme activity influencing host cell intrinsic epigenetic pathways or regulating non coding RNAs Nevertheless a deeper understanding of this epigenetic regulation is required in guiding therapeutic approaches to prevent or combat diseases driven by disrupted microbiota host crosstalk

Immunogenic Cell Death in Cancer: From Benchside Research to Bedside Reality Abhishek D Garg, Patrizia Agostinis, 2016-04-29 Classically anti cancer therapies have always been applied with the primary aim of tumor debulking achieved through widespread induction of cancer cell death While the role of host immune system is frequently considered as host protective in various antigen bearing pathologies or infections yet in case of cancer overtime it was proposed that the host immune system either plays no role in therapeutic efficacy or plays a limited role that is therapeutically unemployable The concept that the immune system is dispensable for the efficacy of anticancer therapies lingered on for a substantial amount of time not only because evidence supporting the claim that anti cancer immunity played a role were mainly contradictory but also largely because it was considered acceptable and sometimes still is to test anticancer therapies in immunodeficient mice i e SCID athymic mice lacking adaptive immune system This latter practice played a detrimental role in appreciating the role of anticancer immunity in cancer therapy This scenario is epitomized by the fact that for a long time the very existence of cancer associated antigens or cancer associated danger signaling remained controversial However over last several years this dogmatic view has been considerably modified The existence of cancer associated antigens and danger signaling has been proven to be incontrovertible These developments have together paved way for the establishment of the attractive concept of immunogenic cell death ICD It has been established that a restricted class of chemotherapeutics

targeted therapeutics radiotherapy photodynamic therapy and certain oncolytic viruses can induce a form of cancer cell death called ICD which is accompanied by spatiotemporally defined emission of danger signals These danger signals along with other factors help cancer cells undergoing ICD to activate host innate immune cells which in turn activate T cell based immunity that helps eradicate live or residual surviving cancer cells The emergence of ICD has been marred by some controversy ICD has been criticized to be either experimental model or setting specific or mostly a concept based on rodent studies that may have very limited implications for clinical application However in recent times it has emerged through mainly retrospective or prognostic studies that ICD can work in various human clinical settings hinting towards clinical applicability of ICD However a widespread consensus on this issue is still transitional In the current Research Topic we aimed to organize and intensify a discussion that strives to bring together the academic and clinical research community in order to provide a background to the current state of the art in ICD associated bench side research and to initiate fruitful discussions on present and future prospects of ICD translating towards the clinical bedside reality **Recent**
