Hybridomas and Monoclonal Antibodies Edgar Engleman, 2013-11-11 Soon after Kohler and Milstein described the use of somatic cell hybridization for the production of murine monoclonal antibodies of desired specificity this relatively simple technique became widely applied Indeed production of murine monoclonal antibodies is now considered routine by immunologists and nonimmunologists alike However as heterologous proteins mouse monoclonal antibodies have one major limitation they are immunogenic in man and hence their use in vivo is severely limited An obvious solution to this problem is to produce human hybridomas with the same techniques used for the production of rodent hybrids Unfortunately the history of human hybridomas has been marked by substantive and often exasperating technical problems and the first reports of hybrids secreting human immunoglobulin of desired specificity did not appear until 1980 These reports were met with initial enthusiasm but it soon became apparent that while human lymphocytes might be fused their frequency level of Ig synthesis and stability were such that production of human antibodies with this method was neither routine nor practical Nonetheless a sufficient number of investigators persevered and during the next 5 years relatively efficient B cell fusion partners as well as improved methods of Epstein Barr virus transformation were developed Generation of human T T hybrids has also been achieved although problems of chromosomal stability remain a substantial obstacle more so than with B cell lines
