Nanomaterials characteristics such as large surface area capacity to easily reach into contaminated sites, good reactivity and possibility of being developed to present photocatalytic activity and or to deal with targeted substances by chemical surface modification are useful specially to perform remediation. As an alternative to conventional physicochemical methods, the green based synthesis protocols reject the use of harmful reagents, prevent waste production, apply renewable energy source and or materials and consider in first place offering the smallest negative impact possible to living beings and to the ecosystem. Green synthesis in nanotechnology field involves the use of seaweeds, bacteria, cyanobacteria, yeasts, fungi, plants, living ones, biomass extracts and or bio derived products to generate the nanomaterials. The introductory chapter will be dedicated to nanomaterials characteristics that enable them to be used in environmental remediation. The first part of the book will be dedicated to organic and inorganic pollution and the threats they pose to living forms, advantages, disadvantages and mechanisms of nanoremediation, comparison between conventional strategies of environmental pollution remediation and the green nanoremediation, carbon based and non carbon based green nanomaterials capable of promoting environs remediation, cost benefits of using nanomaterials and nanoinformatics to a safe nanotechnology. The second part will be dedicated to green nanoremediation of water and soil, microbe based, algae based and plant based synthesis of nanomaterials to nanoremediation. This part will also contain chapters dedicated to relevant nanomaterials for green nanoremediation protocols, nano phytoremediation strategies, strategies to evaluate the efficiency of protocols related to this kind of remediation, main interactions of green nanomaterials and microbes during nanoremediation and as a consequence of it, biocompatibility of green nanomaterials.
