Cincotta, Larry J. Gorenflo, 2011-02-08 In this volume the dynamic patterns of human density and distribution are examined in relation to the viability of native species and the integrity of their habitats Social biological and earth scientists describe their models outline their conclusions from field studies and review the contributions of other scientists whose work is essential to this field The book starts with general theories and broad empirical relationships that help explain dramatic changes in the patterns of the occurrence of species changes that have developed in parallel with human population growth migration and settlement In the following chapters specific biomes and ecosystems are highlighted as the context for human interactions with other species A discussion of the key themes and findings covered rounds out the volume All in all the work presents our species *Homo sapiens* as what we truly have been and will likely remain an influential and often the most influential constituent in nearly every major ecosystem on Earth **The Environmental Implications of Population Dynamics**, 2000 The Earth's population doubled between 1960 and 1999 increasing from three billion to six billion people During that period human induced changes in the global environment accelerated in unprecedented fashion Given continued population growth and environmental degradation it has become paramount that we deepen our understanding of the role played by human population dynamics in environmental change Drawing from the scientific literature this report presents a synthesis of what is known about the role played by human

population factors in environmental change Specifically the report discusses the following The relationship between population factors size distribution and composition and environmental change The primary forces that mediate this relationship technology the institutional and policy contexts and cultural factors Two specific aspects of environmental change that are affected by population dynamics climate change and land use change Implications for policy and further research

Demography and the Anthropocene Larry D. Barnett, 2021-04-19 Environmentalists devote little attention at the moment to the size and growth of the human population To counter this neglect the monograph i includes original graphs showing population size and growth since 1920 in the world as a whole and the United States ii assembles evidence tying the increasing number of people to ecosystem deterioration and its societal consequences and iii analyzes sample survey data to ascertain whether the current disregard of population pressures by U S environmentalists reflects the thinking of Americans generally However even if a nation took steps primarily intended to lower childbearing and immigration the findings of social science research indicate that the steps would not have a substantial lasting impact The discussion which suggests an indirect way by which government may reduce fertility underlines for environmental scholars the importance of studying their subject in a multidisciplinary collaborative setting

The Environmental Implications of Population Dynamics, 2000 The Earth's population doubled between 1960 and 1999 increasing from three billion to six billion people During that period human induced changes in the global environment accelerated in unprecedented fashion Given continued population growth and environmental degradation it has become paramount that we deepen our understanding of the role played by human population dynamics in environmental change Drawing from the scientific literature this report presents a synthesis of what is known about the role played by human population factors in environmental change Specifically the report discusses the following The relationship between population factors size distribution and composition and environmental change The primary forces that mediate this relationship technology the institutional and policy contexts and cultural factors Two specific aspects of environmental change that are affected by population dynamics climate change and land use change Implications for policy and further research
