IEC 61131-3: Programming Industrial Automation Systems Karl Heinz John, Michael Tiegelkamp, 2010-06-16 The rapid advances in performance and miniaturisation in microtechnology are constantly opening up new markets for the programmable logic controller PLC. Specially designed controller hardware or PC based controllers extended by hardware and software with real time capability now control highly complex automation processes. This has been extended by the new subject of safe related controllers aimed at preventing injury by machines during the production process. The different types of PLC cover a wide task spectrum ranging from small network node computers and distributed compact units right up to modular fault tolerant high performance PLCs. They differ in performance characteristics such as processing speed, networking ability or the selection of I/O modules they support. Throughout this book the term PLC is used to refer to the technology as a whole, both hardware and software, and not merely to the hardware architecture. The IEC 61131 programming languages can be used for programming classical PLCs, embedded controllers, industrial PCs and even standard PCs if suitable hardware, e.g. fieldbus board for connecting sensors and actuators, is available.

IEC 61131-3: Programming Industrial Automation Systems Karl-Heinz John, Michael Tiegelkamp, 2013-06-29 The programming of industrial controllers has developed into a fully fledged engineering discipline in its own right over the last few years. It soon became apparent that the concepts and languages used in office automation were not equal to the task. Rugged software and fast adaptability are just two examples of the additional demands made by industrial automation technology. To standardise a variety of modern concepts and languages for the benefit of users, the International Electrotechnical Commission IEC developed a standard for using industrial controllers. Based on experience with existing PLC languages, five programming languages were defined together with a data concept using modern software development methods. This book introduces these new programming concepts, assesses the value of the standard in the industrial context and provides a checklist to enable users to appraise the functionality of a programming system. It also includes two free programming packages on CD-ROM, inviting the reader to try out IEC 61131 programming. The IEC 61131 programming systems OpenPCS and STEP 7 are supplied by infoteam Software GmbH www.infoteam.de and SIEMENS AG www.siemens.de. This book is the product of more than 15 years of experience in the development of PLC programming systems, especially a number of IEC systems. The purpose of writing it was not only to present the user with the formal language structure but also to explain the concepts and methods underlying the different languages.

IEC 61131-3: Programming Industrial Automation Systems, 2001 This practical book gives a comprehensive introduction to the concepts and languages of the new standard IEC 61131 used to program industrial control systems. A summary of the special requirements in programming industrial automation systems and the corresponding features in the IEC 61131-3 standard makes it suitable for students as well as PLC experts. The material is presented in an easy to understand form using numerous examples, illustrations and summary tables. There is also a purchaser's guide and a CD-ROM containing two

Model-Driven Design Using IEC 61499 Li Hsien Yoong, Partha S. Roop, Zeeshan E. Bhatti, Matthew M. Y. Kuo, 2014-11-13 This book describes a novel approach for the design of embedded systems and industrial automation systems using a unified model driven approach that is applicable in both domains The authors illustrate their methodology using the IEC 61499 standard as the main vehicle for specification verification static timing analysis and automated code synthesis The well known synchronous approach is used as the main vehicle for defining an unambiguous semantics that ensures determinism and deadlock freedom The proposed approach also ensures very efficient implementations either on small scale embedded devices or on industry scale programmable automation controllers PACs It can be used for both centralized and distributed implementations Significantly the proposed approach can be used without the need for any run time support This approach for the first time blurs the gap between embedded systems and automation systems and can be applied in wide ranging applications in automotive robotics and industrial control systems Several realistic examples are used to demonstrate for readers how the methodology can enable them to reduce the time to market while improving the design quality and
