Harmony Search Algorithms for Structural Design Optimization

Zong Woo Geem, 2009-09-30 Various structures such as buildings bridges and paved roads play an important role in our lives However these construction projects require large expenditures Designing infrastructure cost efficiently while satisfying all necessary design constraints is one of the most important and difficult tasks for a structural engineer Traditionally mathematical gradient based optimization techniques have been applied to these designs However these gradient based methods are not suitable for discrete design variables such as factory made cross sectional area of structural members Recently researchers have turned their interest to phenomenon mimicking optimization techniques because these techniques have proved able to efficiently handle discrete design variables One of these techniques is harmony search an algorithm developed from musical improvisation that has been applied to various structural design problems and has demonstrated cost savings This book gathers all the latest developments relating to the application of the harmony search algorithm in the

structural design field in order for readers to efficiently understand the full spectrum of the algorithm's potential and to easily apply the algorithm to their own structural problems. This book contains six chapters with the following subjects: standard harmony search algorithm and its applications by Lee; standard harmony search algorithm for steel frame design by Degertekin; adaptive harmony search algorithm and its applications by Saka and Hasan; ebi harmony particle swarm algorithm and its applications by Li and Liu; hybrid algorithm of harmony search particle swarm and parameter calibration of viscoelastic and damage functions by Mun and Geem.

Urban Railway Alignment Optimization: Theory and Practice Yan Gao, Qing He, 2025-08-21. This book falls within the field of urban transportation planning and design with a particular focus on urban railway alignment optimization. It delves into the background, challenges, and objective functions and constraints, including cost, environmental impact, and risk of urban railway alignment design. Furthermore, it presents system reliability modeling approaches for assessing the reliability of parallel railway lines. Additionally, the book emphasizes GIS-based methods for land use analysis and automatic demolition area calculation, as well as the Bayesian Sustainable Intelligent Framework for Enhancing Parallel Railway Reliability, which integrates system reliability analysis, the two-dimensional finite element method, and the Bayesian neural network surrogate model. Lastly, it covers the optimization of railway alignment using approximate dynamic programming, introducing a bi-objective approximate fine-grained optimization model that considers both construction cost and construction risk adjacent to existing operating railways. This book encompasses not only the theoretical foundations of urban railway alignment optimization but also provides detailed case studies of practical applications. These methods and techniques are significant for enhancing the efficiency, sustainability, and economy of urban railway systems, making them highly valuable to professionals involved in urban transportation planning, design, and construction. Combining theoretical analysis with practical applications, it provides abundant illustrations and tables to elucidate complex concepts and methods, employs novel presentation styles such as case studies to demonstrate the practical application of theories, and may include instructional elements like step-by-step guides or practical suggestions to help readers better understand and apply the knowledge. By reading this book, readers can gain insights into the latest methods and techniques in urban railway alignment optimization and learn how to apply them in their work, thereby improving the overall performance and sustainability of urban railway systems. The primary target audience of this book is researchers, practitioners, and students involved in urban transportation planning, design, and construction. Whether for beginners seeking to delve into the field of urban railway alignment optimization or for professionals looking to update their knowledge base, this book is an invaluable resource.

Solving Optimization Problems with the Heuristic Kalman Algorithm Rosario Toscano, 2024-03-21. This text focuses on simple and easy-to-use design strategies for solving complex engineering problems that arise in several fields of engineering design, namely non-convex optimization problems. The main optimization tool used in this book to tackle the problem of nonconvexity is the Heuristic Kalman Algorithm (HKA). The main characteristic of HKA is

the use of a stochastic search mechanism to solve a given optimization problem From a computational point of view the use of a stochastic search procedure appears essential for dealing with non convex problems The topics discussed in this monograph include basic definitions and concepts from the classical optimization theory the notion of the acceptable solution machine learning the concept of preventive maintenance and more The Heuristic Kalman Algorithm discussed in this book applies to many fields such as robust structured control electrical engineering mechanical engineering machine learning reliability and preference models This large coverage of practical optimization problems makes this text very useful to those working on and researching systems design The intended audience includes industrial engineers postgraduates and final year undergraduates in various fields of systems design
