Natural Resources: Material Use

Silicon
Silicon is a brittle crystalline solid that is the second most abundant element in the Earth's crust. It is rarely found alone, or in pure form, so it is usually bonded with other substances.
For example, quartz, has silicon in it and is the most abundant mineral you are walking on the beach, you are walking on or use the silicon in sand or even soil by putting it through a microscope like silicon.

Quartz **Sand**

What do we use silicon for? Think molten glass, solar panels, computer chips, silicon conducting electricity and bands to make better when it heats up, silicon some other things.

Geothermal, Hydroelectric and Tidal Energy

Geothermal is a way of producing energy using the heat below the surface of the Earth. To produce a large amount of energy using this process, areas in large amounts need to be drilled and drilled. In this process, the heat that is harnessed by drilling is used to create electric energy, which in turn can be used to heat our homes. This process does not produce greenhouse gases, but is expensive to get started.

Hydroelectric energy is the process of using the kinetic energy of water into electrical energy. In order to produce energy from water, a dam and reservoir have to be built so that the flow of water running across the turbines can be controlled. When the water is released from the dam, it is controlled so that it can flow across turbines to produce electricity. It can be used with most of these renewable energy sources, while they don't produce greenhouse gases, they can impact the environment. When humans build large dams it changes the movement of water, affecting many of the living organisms that live there.

Tidal energy is the process of using the low and high tides of the ocean to produce electrical energy. Tidal energy uses turbines in the water to produce electricity. The high tides along coastlines, along coastlines, can be used to work efficiently. Impact on wildlife.
