2. In this step you will test an inverting amplifier. All data are to be recorded in Table 20-2. The circuit is illustrated in Figure 20-4. The closed-loop gain is:

$$A_{cl(D)} = -\frac{R_f}{R_i}$$

- Use the same resistors for R_f and R_i as in step 1. Record the measured value of resistance in Table 20-2.
- Using the measured resistance, compute and record the closed-loop gain of the inverting amplifier.
- Calculate V_{out} using the computed closed-loop gain.
- Connect the circuit shown in Figure 20-4. Set the signal generator for a 500 mV_{pp} sine wave at 1 kHz. The generator should have no dc offset.
- Measure and record the output voltage, V_{out} .
- Measure and record the voltage at pin 2. This point is called a *virtual ground* because of the effect of negative feedback.
- Place a 1.0 kΩ test resistor in series with the generator and R_i . Measure the input resistance of the circuit, R_{in} , based on the voltage drop across the test resistor. In this case, you should observe that the drop across the test resistor is about the same as the drop across R_i .
