life expectancy and the ageing of the population have been the subject of attention in Western countries and particularly in Europe for some years now. The challenge of squaring the circle between ends and means as well as between personal aspirations and systemic constraints in health and social care continues to be a major concern for policymakers and all those involved in the delivery of services. This book *Active Ageing and Healthy Living: A Human Centered Approach in Research and Innovation as Source of Quality of Life* presents the results of a number of research projects from the Università Cattolica del Sacro Cuore, the largest private university in Italy and in Europe with a strong commitment to the areas of medicine and health sciences, economics, business, international relations, political science, psychology and communications. Visions and research directions for the future are also presented and discussed. The introduction to the book addresses the challenges posed by an increasingly ageing population and the way in which multidisciplinary research can contribute to positive outcomes. The remainder of the book is divided into two sections. The first proposes promising research directions for future focus and includes papers on demographic change, frailty in the elderly, the role of diet in healthy ageing, active ageing and positive technology. The second section deals with recent developments in research into active ageing and healthy living: AA, nutrition, the role of ICTs for older people, work, retirement and health, and empowering skills for AA. Improving Self-Escape from Underground Coal Mines National Research Council, Division of Behavioral and Social Sciences and Education, Board on Human-Systems Integration, Committee on Mine Safety: *Essential Components of Self-Escape*, 2013-06-26. Coal mine disasters in the United States are relatively rare events; many of the roughly 50,000 miners underground will never have to evacuate a mine in an emergency during their careers. However, for those that do, the consequences have the potential to be devastating. U.S. mine safety practices have received increased attention in recent years because of the highly publicized coal mine disasters in 2006 and 2010. Investigations have centered on understanding both how to prevent or mitigate emergencies and what capabilities are needed by miners to self-escape to a place of safety successfully. This report focuses on the latter: the preparations for self-escape. In the wake of 2006 disasters, the U.S. Congress passed the Mine Improvement and New Emergency Response Act of 2006 (MINER Act), which was designed to strengthen existing mine safety regulations and set forth new measures aimed at improving accident preparedness and emergency response in underground coal mines. Since that time, the efforts of the National Institute of Occupational Safety and Health (NIOSH) and the Mine Safety and Health Administration (MSHA) have contributed to safety improvements in the mining industry. However, the Upper Big Branch mine explosion in 2010 served as a reminder to remain ever vigilant on improving the prevention of mine disasters and preparations to help miners survive in the event of emergencies. This study was set in the context of human systems integration (HSI), a systems approach that examines the interaction of people, tasks, and equipment and technology in the pursuit of a goal. It recognizes this interaction occurs within and is influenced by the broader environmental context. A key premise of human systems integration is that much important information is lost when the various tasks within a system are

considered individually or in isolation rather than in interaction with the whole system Improving Self Escape from Underground Coal Mines the task of self escape is part of the mine safety system
