Abstract

Graphical passwords provide a promising alternative to traditional alphanumeric passwords. They are attractive since people usually remember pictures better than words. In this extended abstract, we propose a simple graphical password authentication system. We describe its operation with some examples, and highlight important aspects of the system.

1 Introduction

User authentication is a fundamental component in most computer security contexts. It provides the basis for access control and user accountability [1]. While there are various types of user authentication systems, alphanumeric usernames/passwords are the most common type of user authentication. They are versatile and easy to implement and use.

Alphanumeric passwords are required to satisfy two contradictory requirements. They have to be easily remembered by a user, while they have to be hard to guess by impostors [2]. Users are known to choose easily guessable and/or short text passwords, which are an easy target of dictionary and brute-force attacks [3, 4, 5]. Enforcing a strong password policy sometimes leads to an opposite effect, as a user may resort to write his or her difficult-to-remember passwords on sticky notes exposing them to direct theft.

In the literature, several techniques have been proposed to reduce the limitations of alphanumeric passwords. One proposed solution is to use an easy to remember long phrases (passphrases) rather than a single word [6]. Another proposed solution is to use graphical passwords, in which graphics (images) are used instead of alphanumeric passwords [7]. This can be achieved by asking the user to select regions from an image rather than typing characters in an alphanumeric password approach.

In this extended abstract, we propose a graphical password authentication system. The system combines graphical and text-based passwords trying to achieve the best of both worlds. In section 2, we provide a brief review of graphical passwords. Then, the proposed system is described in section 3. In section 4, we briefly discuss implementation and highlight some aspects about the proposed system.

2 Graphical Passwords

Graphical passwords refer to using pictures (also drawings) as passwords. In theory, graphical passwords are easier to remember, since humans remember pictures better than words [8]. Also, they should be more resistant to brute-force attacks, since the search space is practically infinite.

In general, graphical passwords techniques are classified into two main categories: recognition-based and recall-based graphical techniques [7]. In recognition-based techniques, a user is authenticated by challenging him/her to identify one or more images he or she chooses during the registration stage. In recall-based techniques, a user is asked to reproduce something that he or she created or selected earlier during the registration stage.

PassPoints is a recognition-based technique, where a user is authenticated by challenging him/her into recognizing human faces [9]. An early recall-based graphical password approach was introduced by Greg Blonder in 1996 [10]. In this approach, a user create a password by clicking on several locations on an image. During authentication, the user must click on those locations. PassPoints builds on Blonder's idea, and overcomes some of the limitations of his scheme [2]. Several other approaches have been surveyed in the following paper [7].

3 Proposed System

The proposed authentication system works as follows. At the time of registration, a user creates a graphical pass-
