for this lab.

## Introduction

What is humidity and how is it important to atmospheric processes? This lab shows how we measure atmospheric moisture and uses two experiments to illustrate its role in energy transfer.

## Objectives

After completing these exercises, you should be able to:

- Measure energy transfer when mixing water of different temperatures or changing its form (solid, liquid, gas)
- Explain how surface moisture affects temperature response to energy fluxes
- Calculate various measures of atmospheric moisture (water vapor) and explain the relationship between them
- Summarize how temperature and humidity influence evaporation rate

**Materials needed:** calculator, straight edge

## Latent Heat

Water is a unique substance because it occurs in three phases (solid, liquid, and vapor) at temperatures and pressures that commonly occur on Earth. The phase change of water is what makes the weather interesting, variable, and often unpredictable. When it changes phase, water either releases or consumes energy—a process

called latent heat transfer. The following two experiments illustrate the concept of latent heat. If you do not have the necessary equipment to conduct these experiments, please read through them anyway, carefully review the section on latent heat in your textbook, and answer the general questions (10–13).
