Machine Interpretation of Line Drawing Images Sergey Ablameyko, Tony Pridmore, 2012-12-06 Line drawing interpretation is a challenging area with enormous practical potential At present many companies throughout the world invest large amounts of money and human resource in the input of paper drawings into computers The technology needed to produce an image of a drawing is widely available but the transformation of these images into more useful forms is an active field of research and development *Machine Interpretation of Line Drawing Images* describes the theory and practice underlying the computer interpretation of line

drawing images and shows how line drawing interpretation systems can be developed The authors show how many of the problems can be tackled and provide a thorough overview of the processes underpinning the interpretation of images of line drawings

CO2-microemulsions with additives Yvonne Pütz, 2015-07-20 Improved building insulation is an important part of today's efforts on energy saving Here nano insulation materials promise especially low thermal conductivity Therefore an easy and cost efficient production of these materials is an aim of present material research One approach towards these materials is the expansion and fixation of polymerisable microemulsions of supercritical blowing agents However the nano sized bubbles are found to undergo undesired coarsening processes In order to reduce the increasing interfacial tension emerging during expansion and therewith the coarsening it was suggested to add low molecular hydrophobic substances to the supercritical microemulsion And indeed the addition of cyclohexane to a microemulsion of the type brine CO2 fluorinated surfactants was found to reduce the fluorinated surfactant content a measure for the interfacial tension considerably In this work a systematic small angle neutron scattering SANS contrast variation was performed and the data were analysed by model independent Fourier analysis It was found that a concentration gradient of cyclohexane inside the CO2 cyclohexane microemulsion droplets forms Interestingly the analysis reveals a depletion zone close to the amphiphilic film which presumably develops due to the known repulsive interactions of cyclohexane and the fluorinated surfactant tails Using a specially designed high pressure SANS cell to perform stroboscopic pressure jumps the influence of cyclohexane on pressure induced elongation of microemulsion droplets as well as the early state of foaming after expansion was studied Here the pressure dependent thermodynamic stability of such microemulsions allows for a fast repeatability of the pressure cycles It turned out that cyclohexane systematically slows down the structural changes in all processes Parallel pressure jump experiments with poly N isopropylacrylamide PNIPAM particles revealed that hydration and dehydration kinetics can be studied with the same experimental setup The first kinetic experiments which combine a CO2 microemulsion mixed with PNIPAM particles indicate that PNIPAM acts as a stabiliser for the microemulsion and further reduces the thermodynamic driving force of the demixing process

in detail In this context the early state of foaming was studied by means of the principle of supercritical microemulsion expansion POSME The benefit of using microemulsions containing a super or near critical fluid as oil component is the thermodynamic stability at high pressures This allows a fast repeatability of the expansion process at nanoscale by applying pressure cycles In combination with a specially designed stroboscopic high pressure cell the structural processes could be observed by time resolved small angle neutron scattering experiments It turned out that the addition of a low molecular oil as anti aging agent results in a deceleration of foam coarsening during expansion by more than an order of magnitude Parallel to these studies the nanofoams by continuity inversion of dispersions NF CID principle was utilized for the preparation of nanoporous polymeric materials The significant innovation of the NF CID principle is the generation of an extremely high number density of propellant pools by a continuity inversion of a CO₂ soaked colloidal crystal i e the formerly discrete polymer nanoparticles convert into a homogeneous matrix with nanodisperse fluid inclusions if the temperature is raised above the glass transition of the respective polymer Expanding those templates by applying a specific set of parameters led to polymethylmethacrylate and polystyrene nanoporous materials that feature pore sizes smaller than 100 nm
