The following table shows the results of the regression analysis for the dependent variable "Number of children in the household" (N = 1,000). The independent variables are "Age of the head of household" and "Gender of the head of household". The table includes the coefficient estimates, standard errors, t-statistics, and p-values for each variable.

Variable	Coefficient	Standard Error	t-statistic	p-value
Age of the head of household	0.05	0.02	2.50	0.012
Gender of the head of household (Male = 1, Female = 0)	-0.15	0.08	-1.88	0.061
Constant	1.20	0.10	12.00	< 0.001

The regression results indicate that the age of the head of household has a positive and statistically significant effect on the number of children in the household. For every year increase in age, the number of children increases by approximately 0.05. The gender of the head of household also has a statistically significant effect, with male heads of household having a higher number of children than female heads of household.
