Orenstein,2009-09-18 Recent years have seen unprecedented outbreaks of avian influenza A viruses In particular highly pathogenic H5N1 viruses have not only resulted in widespread outbreaks in domestic poultry but have been transmitted to humans resulting in numerous fatalities The rapid expansion in their geographic distribution and the possibility that these viruses could acquire the ability to spread from person to person raises the risk that such a virus could cause a global pandemic with high morbidity and mortality An effective influenza vaccine represents the best approach to prevent and control such an emerging pandemic However current influenza vaccines are directed at existing seasonal influenza viruses which have little or no antigenic relationship to the highly pathogenic H5N1 strains Concerns about pandemic preparedness have greatly stimulated research activities to develop eff tive vaccines for pandemic influenza viruses and to overcome the limitations inh ent in current approaches to vaccine production and distribution These

limitations include the use of embryonated chicken eggs as the substrate for vaccine production which is time consuming and could involve potential biohazards in growth of new virus strains Other limitations include the requirement that the current inactivated influenza vaccines be administered using needles and syringes requiring trained personnel which could be a bottleneck when attempting to vaccinate large populations in mass campaigns In addition the current inactivated vaccines that are delivered by injection elicit limited protective immunity in the upper respiratory tract where the infection process is initiated
