

Pressure swing adsorption, (PSA), technology uses columns of carbon molecular sieve, (CMS), to separate compressed air. Oxygen and other waste gases are selectively adsorbed under pressure by the CMS, allowing nitrogen to pass through to the application.

The CMS is regenerated by releasing the pressure in the columns and venting the waste gases to the atmosphere.

The technology is called pressure swing adsorption because the operating pressure "swings" from 0 bar g up to typically 7 bar g to adsorb oxygen and from 7 bar g back to 0 bar g to desorb and release the waste gases.
