Trends in Control and Decision-Making for Human-Robot Collaboration Systems Yue Wang, Fumin Zhang, 2017-01-24 This book provides an overview of recent research developments in the automation and control of robotic systems that collaborate with humans. A measure of human collaboration being necessary for the optimal operation of any robotic system, the contributors exploit a broad selection of such systems to demonstrate the importance of the subject particularly where the environment is prone to uncertainty or complexity. They show how such human strengths as high level decision making flexibility and dexterity can be combined with robotic precision and ability to perform task repetitively or in a dangerous environment. The book focuses on quantitative methods and control design for guaranteed robot performance and balanced human experience from both physical human robot interaction and social human robot interaction. Its contributions develop and expand upon material presented at various international conferences. They are organized into three parts covering one human one robot collaboration, one human multiple robot collaboration and human swarm collaboration. Individual topic areas include resource optimization, human and robotic safety in collaboration, human trust in robot and decision making when collaborating with robots, abstraction of swarm systems to make them suitable for human control, modeling and control of internal force interactions for collaborative manipulation and the sharing of control between human and automated systems etc. Control and decision making algorithms feature prominently in the text, importantly within the context of human factors and the constraints they impose. Applications such as assistive technology, driverless vehicles, cooperative mobile robots, manufacturing robots and swarm robots are considered. Illustrative figures and tables are provided throughout the book. Researchers and students working in controls and the interaction of humans and robots will learn new methods for human robot collaboration from this book and will find the cutting edge of the subject described in depth.

conditions require the development and use of educational methodologies and opportunities with moderate economic demands. Currently, there is an increasing number of educational institutes that respond to this challenge through the creation and adoption of distance education programs in which the teachers and students are separated by physical distance. It has been verified in many cases that with the proper methods and tools, teaching and learning at a distance can be as effective as traditional face-to-face instruction. Today, distance education is primarily performed through the Internet, which is the biggest and most powerful computer network of the World, and the World Wide Web (WWW) which is an effective front end to the Internet and allows the Internet users to uniformly access a large repertory of resources: text, data, images, sound, video, etc. available on the Internet.
