What Sustains Life? Dan W. Urry, 2007-10-18 In the sixth century BC Thales of Miletus father of the Ionian Enlightenment setting aside the mythic views of Homer and Hesiod asked What is the world made of and thereby became the first physicist He answered that water is the basis of all matter and thereupon became an often cited example of early Greek reasoning gone astray However not only did Thales initiate scientific inquiry but also with reference to living things he was substantially correct Living organisms are composed mostly of water but the unique role of water in living organisms has been wanting for adequate description From the perspective of D H Lawrence Water is H₂O hydrogen two parts oxygen one part but there is a third thing that makes it water and nobody knows what that is From our perspective and as advanced in this volume the interaction of water with dissimilar groups comprising each protein molecule the competition for water between these disparate substituents along chain molecules of living organisms and the freedom of motion that water gives protein chains combine to provide the physical basis of Life

Chemical Energy from Natural and Synthetic Gas Yatish T. Shah,2017-03-16 Commercial development of energy from renewables and nuclear is critical to long term industry and environmental goals However it will take time for them to economically compete with existing fossil fuel energy resources and their infrastructures Gas fuels play an important role during and beyond this transition away from fossil fuel dominance to a balanced approach to fossil nuclear and renewable energies Chemical Energy from Natural and Synthetic Gas illustrates this point by examining the many roles of natural and synthetic gas in the energy and fuel industry addressing it as both a transition and end game fuel The book describes various types of gaseous fuels and how are they are recovered purified and converted to liquid fuels and electricity generation and used for other static and mobile applications It emphasizes methane syngas and hydrogen as fuels although other volatile hydrocarbons are considered It also covers storage and transportation infrastructure for natural gas and hydrogen and methods and processes for cleaning and reforming synthetic gas The book also deals applications such as the use of natural gas in power production in power plants engines turbines and vehicle needs Presents a unified and collective look at gas in the energy and fuel industry addressing it as both a transition and end game fuel Emphasizes methane syngas and hydrogen as fuels Covers gas storage and transport infrastructure Discusses thermal gasification gas reforming processing purification and upgrading Describes biogas and bio hydrogen production Deals with the use of natural gas in power production in power plants engines turbines and vehicle needs

Aqueous-phase Catalytic Conversions of Renewable Feedstocks for Sustainable Biorefineries Georgios Papadogianakis,Roger Arthur Sheldon,Yulong Wu ,Dmitry Yu. Murzin,2024-08-23 Today there is growing interest in aqueous phase catalytic conversions for the valorization of renewable biomass based feedstocks for biorefineries to produce in a sustainable way biofuels chemicals power energy materials pharmaceuticals and food This is because of the highly polar nature of water which makes it an ideal medium to convert polar biomass based lignocellulose cellulose hemicellulose lignin with high oxygen content and their upgraded products such as hydrophilic carbohydrates platform chemicals and their derivatives Another reason which makes water the solvent of choice is that water itself is involved either as a reagent or as a byproduct even in large amounts in typical conversions for the valorization of biomass The obtained intermediates further react in the aqueous medium often without any separation and purification to manufacture more valuable products This results in substantial energy savings lower emissions and economic benefits Furthermore water could act as a catalyst in conversions of biomass based feedstocks such as in liquefaction reactions under subcritical conditions Moreover novel types of catalytic reactivity have been observed in the aqueous solvent not only with

water soluble transition metal catalytic complexes but also with conventional heterogeneous catalysts and catalytic nanoparticles in a broad spectrum of different reactions such as inter alia aldol condensations and hydrogenation reactions. For example in the aqueous phase hydrogenation of the biomass based key platform chemical levulinic acid into valerolactone and beyond employing heterogeneous catalysts and nanoparticles the presence of water has a beneficial effect and accelerates the reaction rates whereas in organic solvents much lower activities were observed. This promotional effect of water in the hydrogenation of levulinic acid was proved by many experimental and theoretical studies using a broad spectrum of different types of catalytic systems.

Process Intensification for Sustainable Energy Conversion Fausto Gallucci, Martin van Sint Annaland, 2015-05-12 This book addresses the application of process intensification to sustainable energy production combining two very topical subject areas. Due to the increasing process of petroleum sustainable energy production technologies must be developed for example bioenergy blue energy chemical looping combustion concepts for CO₂ capture etc. Process intensification offers significant competitive advantages because it provides more efficient processes leading to outstanding cost reduction increased productivity and more environment friendly processes.

Solar to Chemical Energy Conversion Masakazu Sugiyama, Katsushi Fujii, Shinichiro Nakamura, 2016-01-25 This book explains the conversion of solar energy to chemical energy and its storage. It covers the basic background interface modeling at the reacting surface energy conversion with chemical electrochemical and photoelectrochemical approaches and energy conversion using applied photosynthesis. The important concepts for converting solar to chemical energy are based on an understanding of the reactions equilibrium and non equilibrium conditions. Since the energy conversion is essentially the transfer of free energy the process are explained in the context of thermodynamics.
