

Identifying the Mutation

Identify the following:

- Substitution mutation:** the replacement of one amino acid by another without changing the overall structure of the protein. This can be caused by a single nucleotide change in the DNA sequence.
- Insertion mutation:** the addition of one or more amino acids to the protein sequence.
- Deletion mutation:** the removal of one or more amino acids from the protein sequence.
- Frameshift mutation:** a mutation that shifts the reading frame of the protein sequence, causing all amino acids downstream to be changed.
- Point mutation:** a mutation that changes a single nucleotide in the DNA sequence, which can result in a substitution, insertion, or deletion.
- Indel mutation:** a mutation that involves the insertion or deletion of one or more nucleotides in the DNA sequence, which can result in a frameshift.
- Repeat expansion:** a mutation that involves the repetition of a sequence of nucleotides in the DNA sequence, which can result in a frameshift.
- Truncation:** a mutation that results in a shorter protein sequence due to a premature stop codon.

Identify the type of mutation for each of the following sequences. Indicate the position of the mutation and the type of mutation. (e.g., "Position 10: Substitution (G to A) in the coding sequence")
