Estimation of Microbial Protein Supply in Ruminants Using Urinary Purine Derivatives Harinder P.S. Makkar, X.B. Chen, 2013-06-05 The Joint FAO IAEA Division of Nuclear Techniques in Food and Agriculture has a long history of coordinating isotope aided research projects for improving animal productivity in developing countries These projects have focused on enhancing the efficiency of animal production through better use of locally available feed resources and those that do not compete with human food As a part of these efforts the Joint Division has been actively involved in developing and simplifying approaches for measuring microbial protein supply to ruminant livestock The contribution of microbial protein in meeting the overall requirement for protein in ruminants is significant but understanding the contribution of microbial protein to the nutrition of ruminant livestock has been hampered by the lack of simple and accurate methods for measuring microbial protein production in vivo A Consultants Meeting was held in 1995 in Vienna to explore the feasibility of using nuclear and related techniques to develop and validate new approaches for measuring microbial protein supply in ruminant animals Based on the available information the consultants considered that the purine derivative excretion method which is non invasive and both simple to use and inexpensive compared with other available methods had the potential for use in developing countries However development of models for various animal species and breeds and their validation were required before this technique could be advocated for use

Handbook of Carbon Offset Programs Anja Kollmuss, Michael Lazarus, Carrie Lee, Maurice LeFranc, Clifford Polycarp, 2010-08-12 Greenhouse gas GHG offsets have long been promoted as an important element of a comprehensive climate policy approach Offset programs can reduce the overall cost of achieving a given emission goal by enabling emission reductions to occur where costs are lower Offsets have the potential to deliver sustainability co benefits through technology development and transfer They can also develop human and institutional capacity for reducing emissions in sectors and locations not included in a cap and trade or a mandatory government policy However offsets can pose a risk to the environmental integrity of climate actions especially if issues surrounding additionality

permanence leakage quantification and verification are not adequately addressed The challenge is to design offset programs and policies that can maximize their potential benefits while minimizing their potential risks This handbook provides a systematic and comprehensive review of existing offset programs It looks at what offsets are how offset mechanisms function and the successes and pitfalls they have encountered Coverage includes offset programs across the full swath of applications including mandatory and voluntary systems government regulated and private markets carbon offset funds and accounting and reporting protocols such as the WBCSD WRI GHG Protocol and ISO 14064 Learning from the successes and failures of these programs will be essential to crafting effective climate policy This is an essential reference for all regulators policy makers business leaders and NGOs concerned with the design and operation of GHG offset programs world wide Published with SEI
