with the help of a psychrometric chart, using a dry bulb Temp. of 68°F and $\phi = 40\%$, we identify condensation temperature to be 42°F. Thus condensation will occur between surfaces 4 and 5.

$$\dot{Q} = UA \Delta T$$

As an example:

$$\dot{Q} = (1.47)(1000)(70 - 68.19) = 2660 \frac{\text{Btu}}{\text{hr}}$$

$$\dot{Q} = (1.47)(1000)(16.81 - 15) = 2660 \frac{\text{Btu}}{\text{hr}}$$

manner using comprehensive examples Beginning with the concept of one dimensional heat transfer the first chapters
include one dimensional problems that can be solved by inspection The book progresses through more detailed two
dimensional elements to three dimensional elements including discussions on various applications and ending with
introductory chapters on the boundary element and meshless methods where more input data must be provided to solve
problems Emphasis is placed on the development of the discrete set of algebraic equations The example problems and
exercises in each chapter explain the procedure for defining and organizing the required initial and boundary condition data
for a specific problem and computer code listings in MATLAB and MAPLE are included for setting up the examples within the
text including COMSOL files Widely used as an introductory Finite Element Method text since 1992 and used in past ASME
short courses and AIAA home study courses this text is intended for undergraduate and graduate students taking Finite
Element Methodology courses engineers working in the industry that need to become familiar with the FEM and engineers
working in the field of heat transfer It can also be used for distance education courses that can be conducted on the web
Highlights of the new edition include Inclusion of MATLAB MAPLE code listings along with several COMSOL files for the
example problems within the text Power point presentations per chapter and a solution manual are also available from the
web Additional introductory chapters on the boundary element method and the meshless method Revised and updated

Gallagher, 1975 MATLAB Codes for Finite Element Analysis A. J. M. Ferreira, 2008-11-06 This book intend to supply
readers with some MATLAB codes for nite element analysis of solids and structures After a short introduction to MATLAB the
book illustrates the nite element implementation of some problems by simple scripts and functions The following problems
are discussed Discrete systems such as springs and bars Beams and frames in bending in 2D and 3D Plane stress problems

Plates in bending Free vibration of Timoshenko beams and Mindlin plates including laminated composites Buckling of Timoshenko beams and Mindlin plates The book does not intend to give a deep insight into the nite element details just the basic equations so that the user can modify the codes The book was prepared for undergraduate science and engineering students although it may be useful for graduate students The MATLAB codes of this book are included in the disk

Readers are welcomed to use them freely The author does not guarantee that the codes are error free although a major effort was taken to verify all of them Users should use MATLAB 7.0 or greater when running these codes Any suggestions or corrections are welcomed by an email to ferreira.fe@up.pt
