

Forces, Rivers, and Wind

Offices tend to make Forces an introductory subject. The objective would be to build progressively on concepts within various contexts/frames/complexity, not necessarily.

Example 1:

The path of upstream boats is affected by the faster current flow. Boats are not as fast upstream as they are.

Example 2:

This velocity is the velocity of the boat in the water, not the velocity of the boat in the air.

Example 3:

Boats are not as fast upstream as they are downstream. The actual direction of the boat is the direction of the river.

$$v_{\text{boat}} + v_{\text{river}} = v_{\text{total}}$$

There, it and it's velocity for the boat, adding up a moving object and a for the water moving the boat, resulting in the total velocity of the boat.

NOTE:

This diagram is a rough sketch of a boat, not a real boat. It's just a rough sketch of a boat.

The diagram is a rough sketch of a boat, not a real boat. It's just a rough sketch of a boat.

1. An example of a boat's path is shown. The boat is moving at a speed of 10 mph. The river is moving at a speed of 10 mph. The boat's path is shown as a straight line. The river's path is shown as a curved line. The boat's path is shown as a straight line. The river's path is shown as a curved line.

Boat's path	River's path	Boat's path	River's path
10 mph	10 mph	10 mph	10 mph
10 mph	10 mph	10 mph	10 mph
10 mph	10 mph	10 mph	10 mph

The boat would actually be going through at an angle of 10 mph from the river.
