Game Theory and Business Applications Kalyan Chatterjee, William Samuelson, William F. Samuelson, 2001-05-31 In the last twenty five years game theory has been applied to a growing number of practical problems from antitrust analysis to monetary policy from the design of auction institutions to the structuring of incentives within firms from patent races to dispute resolution The purpose of Game Theory and Business Applications is to expand these applications of game theory into a broad and meaningful view of the way business decisions can be modelled and analyzed The chapter contents embrace a wide variety of business functions from accounting to finance to operations to strategy and to organizational design In addition specific application areas include numerous kinds of market competition bargaining auctions and competitive bidding All of these applications involve competitive decision settings specifically situations where a number of economic agents in pursuit of their respective self interests take actions that together affect all of their fortunes In the language of game theory players take actions consistent with the given rules of the game and these joint actions determine final outcomes and payoffs As this volume demonstrates game theory provides a compelling guide for business strategy The first section of this volume discusses game theoretic applications in four functional areas of business finance accounting operations management and information systems and organization design The second section considers competitive strategies in imperfect markets Using cooperative and non cooperative game theoretic approaches these four chapters consider various topics spatial competition signaling of product quality trust and cooperation in ongoing relationships strategic behavior in bargaining and the balance of power between the firm and its buyers and suppliers The last section of the book deals in detail with auctions and competitive bidding institutions The emphasis is on the contributions of game theory to both auction theory and practice Topics considered include optimal auctions bidder collusion and the design of institutions for selling the radio spectrum and trading electrical power

Generalized Concavity in Fuzzy Optimization and Decision Analysis Jaroslav Ramík, Milan Vlach, 2012-12-06 Convexity of sets in linear spaces and concavity and convexity of functions lie at the root of beautiful theoretical results that are at the same time extremely useful in the analysis and solution of optimization problems including problems of either single objective or multiple objectives Not all of these results rely necessarily on convexity and concavity some of the results can guarantee that each local optimum is also a global optimum giving these methods broader application to a wider class of problems Hence the focus of the first part of the book is concerned with several types of generalized convex sets and generalized concave functions In addition to their applicability to nonconvex optimization these convex sets and generalized concave functions are used in the book s second part where decision making and optimization problems under uncertainty are investigated Uncertainty in the problem data often cannot be avoided when dealing with practical problems Errors occur in real world data for a host of reasons However over the last thirty years the fuzzy set approach has proved to be useful in these situations It is this approach to optimization under uncertainty that is extensively used and studied in the second part of this book Typically the membership functions of fuzzy sets involved in such problems are neither concave nor convex They are however often quasiconcave or concave in some generalized sense This opens possibilities for application of results on generalized concavity to fuzzy optimization Despite this obvious relation applying the interface of these two areas has been limited to date It is hoped that the combination of ideas and results from the field of generalized concavity on the one hand and fuzzy optimization on the other hand outlined and discussed in *Generalized Concavity in Fuzzy Optimization and Decision Analysis* will be of interest to both communities Our aim is to broaden the classes of problems that the combination of these two areas can satisfactorily address and solve

Level Crossing Methods in Stochastic Models Percy H.

Brill, 2008-12-03 From 1972 to 1974 I was working on a PhD thesis entitled Multiple Server Queues with Service Time Depending on Waiting Time The method of analysis was the embedded Markov chain technique described in the papers 82 and 77 My analysis involved lengthy tedious derivations of systems of integral equations for the probability density function

pdf of the waiting time After pondering for many months whether there might be a faster easier way to derive the integral equations I nally discovered the basic theorems for such a method in August 1974 The theorems establish a connection between sample path level crossing rates of the virtual wait process and the pdf of the waiting time This connection was not found anywhere else in the literature at the time I immediately developed a comprehensive new methodology for deriving the integral equations based on these theorems and called it system point theory Subsequently it was called system point method or system point level crossing method SPLC or simply LC I rewrote the entire PhD thesis from November 1974 to March 1975 using LC to reach solutions The new thesis was called System Point Theory in Exponential Queues On June 12 1975 I presented an invited talk on the new methodology at the Fifth Conference on Stochastic Processes and their Applications at the University of Maryland Many queueing theorists were present
