Parallel Scale-Out Storage Accelerates Discovery

Seismic processing for oil and gas exploration and production has historically been second only to the US government in terms of computer usage. This heavy usage remains a tremendous big data challenge as the size of seismic data sets continues to increase with higher fold and richer azimuths, and as processing algorithms require greater and more complicated access to data. Panasas ActiveStor is optimized for highly demanding HPC storage applications in the energy sector. Landmark SeisSpace/ProMAX software, coupled with JavaSeis and ActiveStor, leads the way in providing solutions for seismic processing for oil and gas exploration.

HIGHLIGHTS

THE SOLUTION

- Panasas ActiveStor – manage your data, not your storage system
- Scale-out NAS performance for big data workloads
- Linear scaling to 6PB and 150GB/s
- Global namespace
- Single point of management

FASTER TIME-TO-RESULTS

- Deployment flexibility
- Seismic processing and imaging
- Visualization and interpretation
- Reservoir simulation and modeling

DISTRIBUTED PARALLEL I/O FOR SEISMIC PROCESSING

Early users of clusters for seismic processing applications used serial I/O on a single node and distributed the data from that one node, creating a major bottleneck. In the mid-2000s, some seismic processing systems began to utilize distributed parallel I/O to eliminate these single node I/O bottlenecks.

Landmark targeted the distributed parallel I/O opportunity by incorporating JavaSeis distributed parallel I/O (see www.javaSeis.org) into its SeisSpace®/ProMAX® software, the leading seismic processing system in the oil and gas industry. While the user community applauded this move, it was clear that many of the legacy storage systems simply could not handle the increased load placed on them by distributed parallel I/O. In fact, some users of SeisSpace/ProMAX with JavaSeis saturated their existing storage systems so completely that they froze up and had to be rebooted. Users working on individual jobs sometimes had to coax their storage systems back into use by initializing a few compute nodes at a time.

THE MOVE TO INTERACTIVE SEISMIC PROCESSING

Seismic processing is at its best when it is highly interactive, but interactive seismic processing has been an elusive goal in the oil and gas industry for decades. The challenge is to be able to handle the ever-increasing volumes of data efficiently so that geophysicists can quickly process data through a large number of compute nodes. The value of interactive processing comes from the ability of the analyst to visualize and process data in minutes and make decisions quickly.

It must also be possible for multiple users to execute similar operations simultaneously. Seismic processing is characterized by multiple jobs run by multiple users concurrently on a single cluster, typically accessing a single storage system. Despite the rise in computational intensity of algorithms like reverse time migration, data I/O continues to be a bottleneck in many seismic processing workflows, fueled by the increased need to analyze the data, quality control the data, and refine velocities in interactive and iterative workflows.
