Veredas,2007-12-31 In this paper we propose a new econometric approach to jointly model the time series dynamics of the trading process and the revisions of ask and bid prices We use this model to test the validity of certain symmetry assumptions

very common among microstructure models. Namely we test whether ask and bid quotes respond symmetrically to trade related shocks and whether buyer initiated trades and seller initiated trades are equally informative. In essence the procedure we propose generalizes Hasbrouck's 1991 vector autoregressive model for signed trades and changes in the quote midpoint by relaxing the implicit symmetry assumptions in his model. The properties of the empirical model are derived from a structural dynamic model for ask and bid prices. In this model ask and bid prices share a common long run component, the efficient price. The long term value of the stock varies due to buyer initiated shocks, seller initiated shocks, and trade unrelated shocks. The transitory components of ask and bid prices are characterized by two correlated and trade dependent stochastic processes whose dynamics are allowed to differ. The trading process is endogenous. Buyer and seller initiated trades are generated by two idiosyncratic but mutually dependent stochastic processes. The generating processes of quotes and trades both depend on several exogenous variables that feature the trades and the market conditions. **Machine**

Learning and AI in Finance German Creamer, Gary Kazantsev, Tomaso Aste, 2021-04-06. The significant amount of information available in any field requires a systematic and analytical approach to select the most critical information and anticipate major events. During the last decade the world has witnessed a rapid expansion of applications of artificial intelligence. AI and machine learning (ML) algorithms to an increasingly broad range of financial markets and problems. Machine learning and AI algorithms facilitate this process: understanding, modelling, and forecasting the behaviour of the most relevant financial variables. The main contribution of this book is the presentation of new theoretical and applied AI perspectives to find solutions to unsolved finance questions. This volume proposes an optimal model for the volatility smile for modelling high frequency liquidity demand and supply and for the simulation of market microstructure features. Other new AI developments explored in this book include building a universal model for a large number of stocks, developing predictive models based on the average price of the crowd, forecasting the stock price using the attention mechanism in a neural network, clustering multivariate time series into different market states, proposing a multivariate distance nonlinear causality test, and filtering out false investment strategies with an unsupervised learning algorithm. **Machine Learning and AI in Finance** explores the most recent advances in the application of innovative machine learning and artificial intelligence models to predict financial time series, to simulate the structure of the financial markets, to explore nonlinear causality models, to test investment strategies, and to price financial options. The chapters in this book were originally published as a special issue of the *Quantitative Finance* journal. **Limit Order Books** Frédéric Abergel, Marouane Anane, Anirban Chakraborti, Aymen Jedidi, Ioane Muni Toke, 2016-05-09.
