

The male reproductive system

The male reproductive system is a series of organs located outside and in pelvis region. The male reproductive systems main purpose is to provide sperm to fertilize the ovum. The major parts of the male are the sperm production and storage.

The first category is sperm production and storage. The production of sperm occurs in the testes. Sperm that is not the ejaculatory fluid producing glands which include the yet developed travels to the duct behind the testis where it is kept and allowed to mature. The actual glands to produce semen are comprised of the seminal vesicles, prostate, and the vas deferens. Lastly, are those used for sex, and deposition of the sperm, these include the penis, urethra, vas deferens, and Cowper's gland Secondary sexual characteristics includes things like deepened voice, larger muscular stature body hair, and development of an Adam's apple. An important sexual hormone of males is androgen, and testosterone.

This hormone controls sperm development, facial hair and how deep your voice is. The outer structures of the female system are comprised of the clitoris, labia majora, labia minora, and Bartholin's glands. The major internal organs of the female reproductive system include the vagina and uterus which act as the receptacle for semen, and the ovaries, which produce the female's ova which is the egg cell. The vagina is connected to the uterus through the cervix, the fallopian tubes attach the uterus to the ovaries. During hormonal changes a female's uterus releases an egg and it travels down the fallopian tube. If It's not fertilized by sperm then the eggs is discarded through menstruation. However, if sperm finds its way into the egg, the fertilized egg attaches itself to the inner wall of the uterus.
