Background:

DNA is the molecule that stores the genetic information in your cells. That information is coded in the four bases of DNA: C, G, A, and T. The DNA directs the functions of the cell on a daily basis and will also be used to pass on the genetic information to the next generation. Because of its critical role in all the functions of the cell, DNA is kept protected in the nucleus of eukaryotic cells.

DNA is organized into sections called genes. Gene code for proteins, and it is proteins that do all the work in the cell. They function as structural proteins that serve as the building blocks of cells and bodies. They also function as enzymes, who are the little molecular chemists in bodies.

Proteins are made in the cytoplasm by protein factories called ribosomes. So, the information from DNA must be transmitted from the nucleus to the cytoplasm. Each gene on the DNA is read and codes directly for mRNA molecules. The mRNA is made by matching its complementary bases- C, G, A, and U to the DNA bases. The mRNA molecule then leaves the nucleus and carries the code for making the p[rotein from the DNA gene to the ribosome in the cytoplasm.

The ribosome reads the sequence of bases on the mRNA in sets of three called codons. Another type of RNA, tRNA, brings the protein building blocks, amino acids, to the ribosome as they are needed. The ribosome bonds the amino acids together to build the protein coded for by the gene back in the nucleus.

Procedure:

1. Your group should obtain one sheet of paper with your four sections of DNA. Cut the strips out along straight lines and tape them together to make a long one-sided DNA molecule. Each section is numbered. Lay them out on the desk from left (#1) to right (#4). See the diagram below.

2. We are going to use this section of our DNA as a gene to make a protein the cell needs. Remember it used to be part of a double-stranded DNA molecule. But it has already been unzipped and now will be used as the template to build your mRNA, one base at a time. So first design an RNA polymerase enzyme to do this mRNA synthesis job.
3. **TRANSCRIPTION:** You have been supplied with mRNA nucleotide bases. Build a mRNA molecule from this gene by matching the mRNA bases to your DNA template, one base at a time. Tape this mRNA molecule along its length to simulate the strong bonds that the RNA polymerase makes between the mRNA bases. This way, it will be a stable molecule and can

Science and Faith in Harmony Sy Garte, 2024-02-13 Rather than discord between science and Christian faith there is a harmony as grand as any choral masterpiece. The idea that Christianity and science are inextricably in conflict is a relatively recent conception. However with each new scientific discovery and scriptural insight it's an idea that's being proved to be insupportable. Sy Garte has immersed himself in both science and faith and knows they work beautifully together to sing of the greatness of God. Now this respected scientist shares how God's world, nature and science and God's word made flesh in Christ are bound together in loving harmony. In *Science and Faith in Harmony* Garte examines modern scientific concepts and what they can teach us about theological truths such as the dual nature of Christ. He explores the ways in which the terminology and language of science and faith consistently match each other. Despite his deep dives into theology and science Garte does not get overly technical in his writing. Instead he is personal and passionate speaking directly to readers with a tone of joy and wonder inviting them to join the chorus of praise to the Lord. Readers still wondering whether the truths of science and Christian faith are in conflict need this book. Following the path of Christ and holding a scientific worldview at the same time is not only possible but also leads to a fuller, richer life of harmony and truth.
